#### **Declaration of Conformity:**

#### Invertek Drives Limited Offas Dyke Business Park Welshpool Powys UK

SY21 8JF

Invertek Drives Ltd hereby states that the Optidrive ODP-2 product range conforms to the relevant safety provisions of the Low Voltage Directive 2006/95/EC and the EMC Directive 2004/108/EC and has been designed and manufactured in accordance with the following harmonised European standards:

narmoniscu European standarus.	
EN 61800-5-1: 2003	Adjustable speed electrical power drive systems. Safety requirements. Electrical, thermal and energy.
EN 61800-3 2 <sup>nd</sup> Ed: 2004	Adjustable speed electrical power drive systems. EMC requirements and specific test methods
EN 55011: 2007	Limits and Methods of measurement of radio disturbance characteristics of industrial, scientific and medical (ISM)
	radio-frequency equipment (EMC)
EN60529 : 1992	Specifications for degrees of protection provided by enclosures

#### Safe Torque OFF ("STO") Function

Optidrive P2 incorporates a hardware STO (Safe Torque Off) Function, designed in accordance with the standards listed below.

Standard	Classification	Independent Approval
EN 61800-5-2:2007	Type 2	
EN ISO 13849-1:2006	PL "d"	
EN 61508 (Part 1 to 7)	SIL 2	*TUV
EN60204-1	Uncontrolled Stop "Category 0"	
EN 62061	SIL CL 2	

\*Note: TUV Approval of the "STO" function is relevant for drives which have a TUV logo applied on drive rating label.

#### **Electromagnetic Compatibility**

All Optidrives are designed with high standards of EMC in mind. All versions suitable for operation on Single Phase 230 volt and Three Phase 400 volt supplies and intended for use within the European Union are fitted with an internal EMC filter. This EMC filter is designed to reduce the conducted emissions back into the supply via the power cables for compliance with harmonised European standards.

It is the responsibility of the installer to ensure that the equipment or system into which the product is incorporated complies with the EMC legislation of the country of use. Within the European Union, equipment into which this product is incorporated must comply with the EMC Directive 2004/108/EC. When using an Optidrive with an internal or optional external filter, compliance with the following EMC Categories, as defined by EN61800-3:2004 can be achieved:

Drive Type / Rating			EMC Category					
		Cat C1	Cat C2	Cat C3				
1 Phase, 230 Volt Input			No additional filtering required	•				
ODP-2-x2xxx-1xFxx-xx			Use shielded motor cable					
3 Phase, 400 Volt Input		Use Additional External Filter	No additional fil	tering required				
IP20 & IP66 Models ODP-2-x4xxx-3xFxx-xx			Use Shielded Motor Cable					
3 Phase, 400 Volt Input		Use Additio	nal External Filter	No Additional Filtering Required				
IP55 Models ODP-2-x4xxx-3xFxN-xx		Use Shielded Motor Cable						
3 Phase, 525 & 600 Volt ODP-2-x5xxx-3x0xx-xx ODP-2-x6xxx-3x0xx-xx	Input	These models are excluded from the Declaration of conformity to eh EMC Directive. Compliance may require the use of additional EMC filters, contact your local Sales Partner for further assistance						
Note		standards is dependent on a number o le lengths and installation methods add	f factors including the environment in which opted.	the drive is installed, motor switching				
For motor cat	le lengti	ns greater than 100m, an output dv / dt	filter must be used, please refer to the Inver	tek Stock Drives Catalogue for further				
details								
Vector Speed	and Toro	que control modes may not operate cor	rrectly with long motor cables and output filte	ers. It is recommended to operate in V/F				
mode only for	<sup>,</sup> cable le	ngths exceeding 50m

All Invertek Optidrive P2 units carry a 2 year warranty against manufacturing defects from the date of manufacture. The manufacturer accepts no liability for any damage caused during or resulting from transport, receipt of delivery, installation or commissioning. The manufacturer also accepts no liability for damage or consequences resulting from inappropriate, negligent or incorrect installation, incorrect adjustment of the operating parameters of the drive, incorrect matching of the drive to the motor, incorrect installation, unacceptable dust, moisture, corrosive substances, excessive vibration or ambient temperatures outside of the design specification.

The local distributor may offer different terms and conditions at their discretion, and in all cases concerning warranty, the local distributor should be contacted first.

#### This user guide is the "original instructions" document. All non-English versions are translations of the "original instructions".

Contents of this User Guide are believed to be correct at the time of printing. In the interest of a commitment to a policy of continuous improvement, the manufacturer reserves the right to change the specification of the product or its performance or the contents of the User Guide without notice.

#### This User Guide is for use with version 2.00 Firmware. User Guide Revision 2.00

Invertek Drives Ltd adopts a policy of continuous improvement and whilst every effort has been made to provide accurate and up to date information, the information contained in this User Guide should be used for guidance purposes only and does not form the part of any contract.

#### 1. Introduction

#### 1.1. Important safety information

#### Please read the IMPORTANT SAFETY INFORMATION below, and all Warning and Caution information elsewhere.

	,		0
Â	Danger : Indicates a risk of electric shock, which, if not avoided, could result in damage to the equipment and possible injury or death.		Danger : Indicates a potentially hazardous situation other than electrical, which if not avoided, could result in damage to property.
	This variable speed drive product (Optidrive) is intended for p part of a fixed installation. If installed incorrectly it may prese carries a high level of stored electrical energy, and is used to required to system design and electrical installation to avoid l malfunction. Only qualified electricians are allowed to install a	nt a safety ha control mech nazards in eit	azard. The Optidrive uses high voltages and currents, anical plant that may cause injury. Close attention is her normal operation or in the event of equipment

System design, installation, commissioning and maintenance must be carried out only by personnel who have the necessary training and experience. They must carefully read this safety information and the instructions in this Guide and follow all information regarding transport, storage, installation and use of the Optidrive, including the specified environmental limitations.

1	Æ	
Z	7	7

Do not perform any flash test or voltage withstand test on the Optidrive. Any electrical measurements required should be	
carried out with the Optidrive disconnected.	

Electric shock hazard! Disconnect and ISOLATE the Optidrive before attempting any work on it. High voltages are present at the
terminals and within the drive for up to 10 minutes after disconnection of the electrical supply. Always ensure by using a
suitable multimeter that no voltage is present on any drive power terminals prior to commencing any work.

Where supply to the drive is through a plug and socket connector, do not disconnect until 10 minutes have elapsed after turning off the supply.

Ensure correct earthing connections and cable selection as per defined by local legislation or codes. The drive may have a leakage current of greater than 3.5mA; furthermore the earth cable must be sufficient to carry the maximum supply fault current which normally will be limited by the fuses or MCB. Suitably rated fuses or MCB should be fitted in the mains supply to the drive, according to any local legislation or codes.

Do not carry out any work on the drive control cables whilst power is applied to the drive or to the external control circuits. The "Safe Torque Off" Function does not prevent high voltages from being present at the drives power terminals.

Within the European Union, all machinery in which this product is used must comply with the Machinery Directive 2006/42/EC, Safety of Machinery. In particular, the machine manufacturer is responsible for providing a main switch and ensuring the electrical equipment complies with EN60204-1.

The level of integrity offered by the Optidrive control input functions – for example stop/start, forward/reverse and maximum speed, is not sufficient for use in safety-critical applications without independent channels of protection. All applications where malfunction could cause injury or loss of life must be subject to a risk assessment and further protection provided where needed.

The driven motor can start at power up if the enable input signal is present.

The STOP function does not remove potentially lethal high voltages. ISOLATE the drive and wait 10 minutes before starting any work on it. Never carry out any work on the Drive, Motor or Motor cable whilst the input power is still applied.

The Optidrive can be programmed to operate the driven motor at speeds above or below the speed achieved when connecting the motor directly to the mains supply. Obtain confirmation from the manufacturers of the motor and the driven machine about suitability for operation over the intended speed range prior to machine start up.

Do not activate the automatic fault reset function on any systems whereby this may cause a potentially dangerous situation. IP55 and IP66 drives provide their own pollution degree 2 environments. IP20 drives must be installed in a pollution degree 2 environment, mounted in a cabinet with IP54 or better.

Optidrives are intended for indoor use only.

When mounting the drive, ensure that sufficient cooling is provided. Do not carry out drilling operations with the drive in place, dust and swarf from drilling may lead to damage.

The entry of conductive or flammable foreign bodies should be prevented. Flammable material should not be placed close to the drive

Relative humidity must be less than 95% (non-condensing).

Ensure that the supply voltage, frequency and no. of phases (1 or 3 phase) correspond to the rating of the Optidrive as delivered.

Never connect the mains power supply to the Output terminals U, V, W.

Do not install any type of automatic switchgear between the drive and the motor

Wherever control cabling is close to power cabling, maintain a minimum separation of 100 mm and arrange crossings at 90 degrees

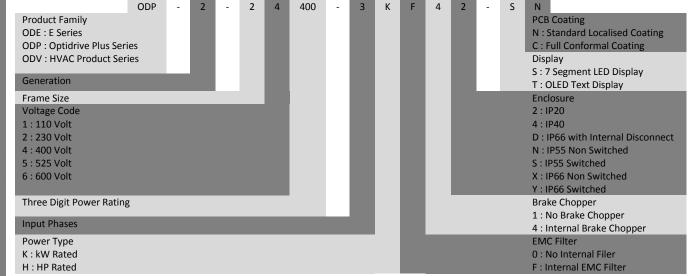

Ensure that all terminals are tightened to the appropriate torque setting

Do not attempt to carry out any repair of the Optidrive. In the case of suspected fault or malfunction, contact your local Invertek Drives Sales Partner for further assistance.

#### 2. General Information and Ratings

#### 2.1. Part Number Construction and Definition

The model number of each Optidrive P2 is constructed according to the following system.

#### 2.2. Drive model numbers – IP20

-SN Standard Seven Segment LED Display, standard PCB coating

-SC Standard Seven Segment LED Display, additional PCB conformal coating

-TN OLED Text Display, standard PCB coating

-TC OLED Text Display, additional PCB conformal coating

2

#### 3. Mechanical Installation

#### 3.1. General

- The Optidrive should be mounted in a vertical position only, on a flat, flame resistant, vibration free mounting using the integral mounting holes or DIN Rail clip (Frame Size 2 only).
- The Optidrive must be installed in a pollution degree 1 or 2 environment only.
- Do not mount flammable material close to the Optidrive
- Ensure that the minimum cooling air gaps, as detailed in section 3.5 and 3.7 are left clear
- Ensure that the ambient temperature range does not exceed the permissible limits for the Optidrive given in section 10.1
- Provide suitable clean, moisture and contaminant free cooling air sufficient to fulfil the cooling requirements of the Optidrive

#### 3.2. Before Installation

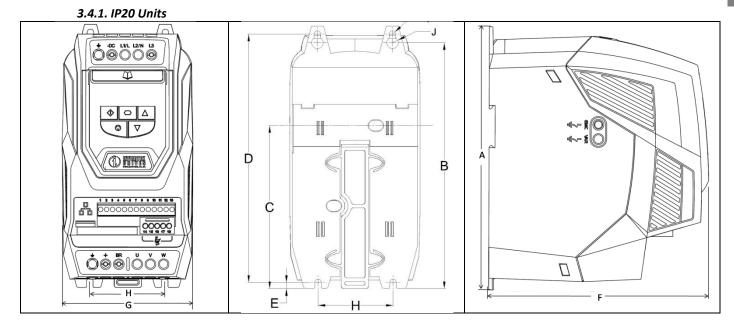

- Carefully Unpack the Optidrive and check for any signs of damage. Notify the shipper immediately if any exist.
- Check the drive rating label to ensure it is of the correct type and power requirements for the application.
- To prevent accidental damage always store the Optidrive in its original box until required. Storage should be clean and dry and within the temperature range –40°C to +60°C

#### 3.3. UL Compliant Installation

Note the following for UL-compliant installation:

- For an up to date list of UL compliant products, please refer to UL listing NMMS.E226333
- The drive can be operated within an ambient temperature range as stated in section 10.1
- For IP20 units, installation is required in a pollution degree 1 environment
- For IP55 & IP66 units, installation in a pollution degree 2 environmant is permissible
- UL Listed ring terminals / lugs must be used for all bus bar and grounding connections
- Refer to section 10.3 on page 48 for Additional Information for UL Approved Installations.

#### 3.4. Mechanical dimensions and weights

#### 3.5. Guidelines for Enclosure mounting (IP20 Units)

- IP20 drives are suitable for use in pollution degree 1 environments, according to IEC-664-1. For pollution degree 2 or higher environments, drives should be mounted in a suitable control cabinet with sufficient ingress protection to maintain a pollution degree 1 environment around the drive.
- Enclosures should be made from a thermally conductive material.
- Ensure the minimum air gap clearances around the drive as shown below are observed when mounting the drive.
- Where ventilated enclosures are used, there should be venting above the drive and below the drive to ensure good air circulation. Air should be drawn in below the drive and expelled above the drive.
- In any environments where the conditions require it, the enclosure must be designed to protect the Optidrive against ingress of airborne dust, corrosive gases or liquids, conductive contaminants (such as condensation, carbon dust, and metallic particles) and sprays or splashing water from all directions.
- High moisture, salt or chemical content environments should use a suitably sealed (non-vented) enclosure.

The enclosure design and layout should ensure that the adequate ventilation paths and clearances are left to allow air to circulate through the drive heatsink. Invertek Drives recommend the following minimum sizes for drives mounted in non-ventilated metallic enclosures:-

Drive	Х			Y		Z	Recommended			
Size	Above &		Either		Between		airflow			
	Be	low	Si	de	between					
	mm	in	mm	in	mm	in	CFM (ft <sup>3</sup> /min)			
2	75	2.95	50	1.97	46	1.81	11			
3	100	3.94	50	1.97	52	2.05	26			

Note :

Dimension Z assumes that the drives are mounted side-by-side with no clearance.

Typical drive heat losses are 3% of operating load conditions.

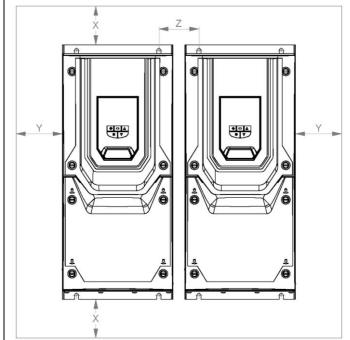

Above are guidelines only and the operating ambient temperature of the drive MUST be maintained at all times.

#### 3.6. Mounting the Drive – IP20 Units

- IP20 Units are intended for installation within a control cabinet.
- When mounting with screws
  - Using the drive as a template, or the dimensions shown above, mark the locations for drilling
  - Ensure that when mounting locations are drilled, the dust from drilling does not enter the drive
  - $\circ$   $\quad$  Mount the drive to the cabinet backplate using suitable M5 mounting screws
  - Position the drive, and tighten the mounting screws securely
- When Din Rail Mounting (Frame Size 2 Only)
  - $\circ$  ~ Locate the DIN rail mounting slot on the rear of the drive onto the top of the DIN rail first
  - o Press the bottom of the drive onto the DIN rail until the lower clip attaches to the DIN rail
  - If necessary, use a suitable flat blade screw driver to pull the DIN rail clip down to allow the drive to mount securely on the rail
  - To remove the drive from the DIN rail, use a suitable flat blade screwdriver to pull the release tab downwards, and lift the bottom of the drive away from the rail first

#### 3.7. Guidelines for mounting (IP55 Units)

- Before mounting the drive, ensure that the chosen location meets the environmental condition requirements for the drive shown in section 10.1
- The drive must be mounted vertically, on a suitable flat surface
- The minimum mounting clearances as shown in the table below must be observed
- The mounting site and chosen mountings should be sufficient to support the weight of the drives
- IP55 units do not require mounting inside an electrical control cabinet; however they may be if desired.

Drive	2	x	Y			
Size	Abo	ve &	Either			
	Be	low	Side			
	mm	in	mm	in		
4	200	7.87	10	0.39		
5	200	7.87	10	0.39		
6	200	7.87	10	0.39		
7	200	7.87	10	0.39		

Note :

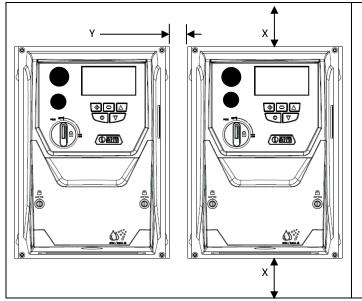

Typical drive heat losses are approximately 3% of operating load conditions.

Above are guidelines only and the operating ambient temperature of the drive MUST be maintained at all times.

- Using the drive as a template, or the dimensions shown above, mark the locations required for drilling
- Suitable cable glands to maintain the IP protection of the drive are required. Gland sizes should be selected based on the number and size of the required connection cables. Drives are supplied with a plain, undrilled gland plate to allow the correct hole sizes to be cut as required. Remove the gland plate from the drive prior to drilling.

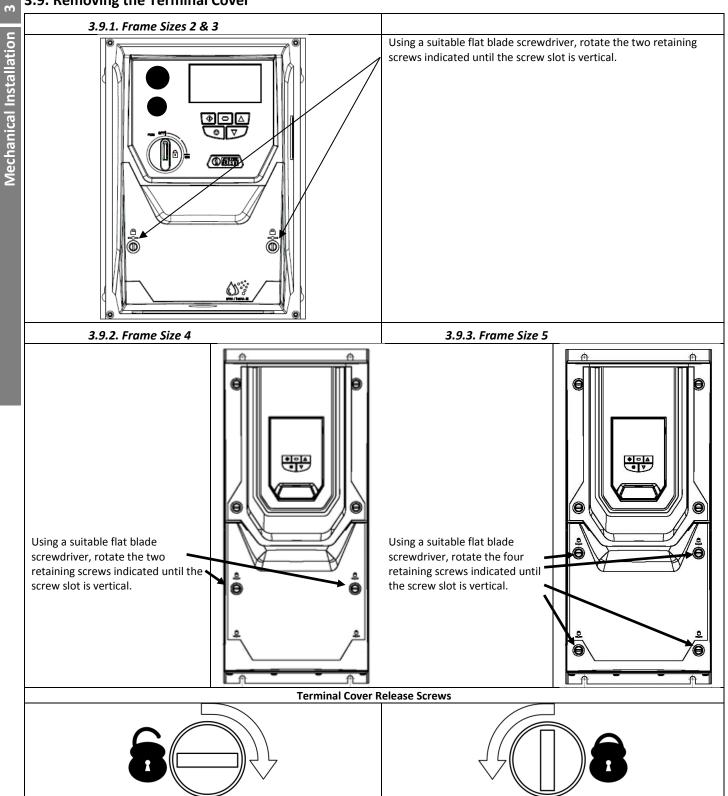

#### 3.8. Guidelines for mounting (IP66 Units)

- Before mounting the drive, ensure that the chosen location meets the environmental condition requirements for the drive shown in section 10.1
- The drive must be mounted vertically, on a suitable flat surface
- The minimum mounting clearances as shown in the table below must be observed
- The mounting site and chosen mountings should be sufficient to support the weight of the drives

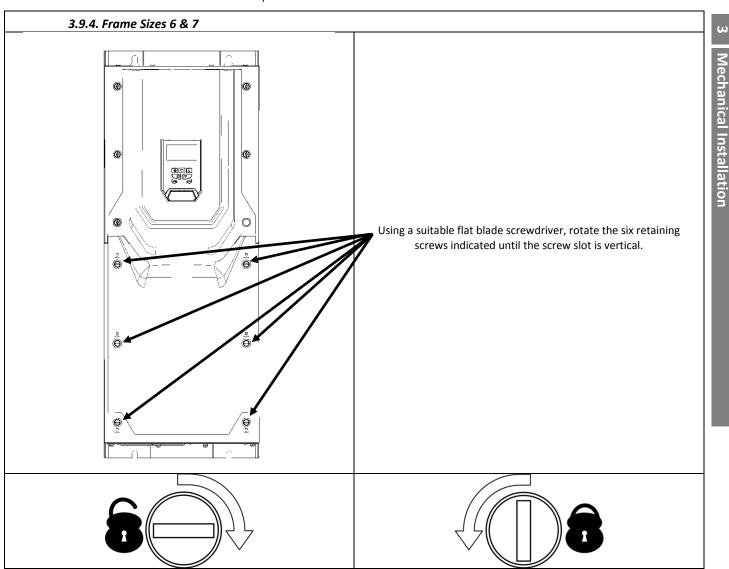

Drive	х			Y		
Size	Above &	k		Eithe

- Using the drive as a template, or the dimensions shown above, mark the locations required for drilling
- Suitable cable glands to maintain the ingress protection of the drive are required. Gland holes for power and motor cables are premoulded into the drive enclosure, recommended gland sizes are shown above. Gland holes for control cables may be cut as required.

#### 3.9. Removing the Terminal Cover

#### 3.10. Routine Maintenance

The drive should be included within the scheduled maintenance program so that the installation maintains a suitable operating environment, this should include:

- Ambient temperature is at or below that set out in the "Environment" section.
- Heat sink fans freely rotating and dust free.
- The Enclosure in which the drive is installed should be free from dust and condensation; furthermore ventilation fans and air filters should be checked for correct air flow.

Checks should also be made on all electrical connections, ensuring screw terminals are correctly torqued; and that power cables have no signs of heat damage.

#### 4. Electrical Installation

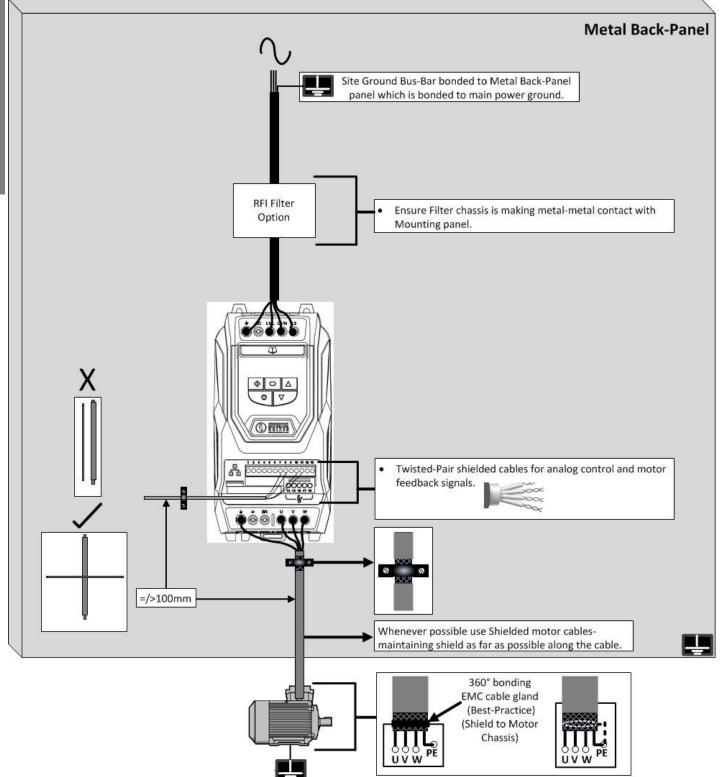

#### 4.1. Grounding the Drive

This manual is intended as a guide for proper installation. Invertek Drives Ltd cannot assume responsibility for the compliance or the non-compliance to any code, national, local or otherwise, for the proper installation of this drive or associated equipment. A hazard of personal injury and/or equipment damage exists if codes are ignored during installation.

This Optidrive contains high voltage capacitors that take time to discharge after removal of the main supply. Before working on the drive, ensure isolation of the main supply from line inputs. Wait ten (10) minutes for the capacitors to discharge to safe voltage levels. Failure to observe this precaution could result in severe bodily injury or loss of life.

Only qualified electrical personnel familiar with the construction and operation of this equipment and the hazards involved should install, adjust, operate, or service this equipment. Read and understand this manual and other applicable manuals in their entirety before proceeding. Failure to observe this precaution could result in severe bodily injury or loss of life.

#### 4.1.1. Recommended installation for EMC compliance

#### 4.1.2. Grounding Guidelines

The ground terminal of each Optidrive should be individually connected DIRECTLY to the site ground bus bar (through the filter if installed). Optidrive ground connections should not loop from one drive to another, or to, or from any other equipment. Ground loop impedance must confirm to local industrial safety regulations. To meet UL regulations, UL approved ring crimp terminals should be used for all ground wiring connections.

The drive Safety Ground must be connected to system ground. Ground impedance must conform to the requirements of national and local industrial safety regulations and/or electrical codes. The integrity of all ground connections should be checked periodically.

#### 4.1.3. Protective Earth Conductor

The Cross sectional area of the PE Conductor must be at least equal to that of the incoming supply conductor.

#### 4.1.4. Safety Ground 佳

This is the safety ground for the drive that is required by code. One of these points must be connected to adjacent building steel (girder, joist), a floor ground rod, or bus bar. Grounding points must comply with national and local industrial safety regulations and/or electrical codes.

#### 4.1.5. Motor Ground

The motor ground must be connected to one of the ground terminals on the drive.

#### 4.1.6. Ground Fault Monitoring

As with all inverters, a leakage current to earth can exist. The Optidrive is designed to produce the minimum possible leakage current whilst complying with worldwide standards. The level of current is affected by motor cable length and type, the effective switching frequency, the earth connections used and the type of RFI filter installed. If an ELCB (Earth Leakage Circuit Breaker) is to be used, the following conditions apply: -

- A Type B Device must be used
- The device must be suitable for protecting equipment with a DC component in the leakage current
- Individual ELCBs should be used for each Optidrive

#### 4.1.7. Shield Termination (Cable Screen)

The safety ground terminal provides a grounding point for the motor cable shield. The motor cable shield connected to this terminal (drive end) should also be connected to the motor frame (motor end). Use a shield terminating or EMI clamp to connect the shield to the safety ground terminal.

#### 4.2. Wiring Precautions

Connect the Optidrive according to section 4.3, ensuring that motor terminal box connections are correct. There are two connections in general: Star and Delta. It is essential to ensure that the motor is connected in accordance with the voltage at which it will be operated. For more information, refer to section 4.6 Motor Terminal Box Connections.

It is recommended that the power cabling should be 4-core PVC-insulated screened cable, laid in accordance with local industrial regulations and codes of practice.

#### 4.3. Incoming Power Connection

- For 1 phase supply, power should be connected to L1/L, L2/N.
- For 3 phase supplies, power should be connected to L1, L2, and L3. Phase sequence is not important.
- For compliance with CE and C Tick EMC requirements, a symmetrical shielded cable is recommended.
- For compliance with CSA requirements, transient surge suppression shall be installed on the line side of this equipment and shall be rated 600V (phase to ground), 600V (phase to phase), suitable for overvoltage category III, and shall provide protection for a rated impulse withstand voltage peak of 4 kV or equivalent.
- A fixed installation is required according to IEC61800-5-1 with a suitable disconnecting device installed between the Optidrive and the AC Power Source. The disconnecting device must conform to the local safety code / regulations (e.g. within Europe, EN60204-1, Safety of machinery).
- The cables should be dimensioned according to any local codes or regulations. Guideline dimensions are given in section 10.2.
- Suitable fuses to provide wiring protection of the input power cable should be installed in the incoming supply line, according to the data in section 10.2. The fuses must comply with any local codes or regulations in place. In general, type gG (IEC 60269) or UL type T fuses are suitable; however in some cases type aR fuses may be required. The operating time of the fuses must be below 0.5 seconds.
- Where allowed by local regulations, suitably dimensioned type B MCB circuit breakers of equivalent rating may be utilised in place of fuses, providing that the clearing capacity is sufficient for the installation.
- When the power supply is removed from the drive, a minimum of 30 seconds should be allowed before re-applying the power. A minimum of 5 minutes should be allowed before removing the terminal covers or connection.
- The maximum permissible short circuit current at the Optidrive Power terminals as defined in IEC60439-1 is 100kA.
- An optional Input Choke is recommended to be installed in the supply line for drives where any of the following conditions occur:-
  - $\circ$  ~ The incoming supply impedance is low or the fault level / short circuit current is high
  - $\circ$   $\quad$  The supply is prone to dips or brown outs
  - $\circ$   $\quad$  An imbalance exists on the supply (3 phase drives)
  - $\circ$  The power supply to the drive is via a busbar and brush gear system (typically overhead Cranes).
- In all other installations, an input choke is recommended to ensure protection of the drive against power supply faults.

#### 4.4. Operation of 3 Phase drives from a Single Phase Supply

A special function of Optidrive P2 allows all drives designed for operation on 3 phase supplies to be operated on a single phase supply of the correct rated voltage at up to 50% of the nominal capacity.

For Example, Model Number ODP-2-64450-3KA4N can be operated on a single phase supply, 380 – 480 volts, with the maximum output current limited to 45 Amps

The supply should be connected to the L1 and L2 terminals of the drive.

#### 4.5. Drive and Motor Connection

- The drive inherently produces fast switching of the output voltage (PWM) to the motor compared to the mains supply, for motors which have been wound for operation with a variable speed drive then there is no preventative measures required, however if the quality of insulation is unknown then the motor manufacturer should be consulted and preventative measures may be required.
- The motor should be connected to the Optidrive U, V, and W terminals using a suitable 3 or 4 core cable. Where a 3 core cable is utilised, with the shield operating as an earth conductor, the shield must have a cross sectional area at least equal to the phase conductors when they are made from the same material. Where a 4 core cable is utilised, the earth conductor must be of at least equal cross sectional area and manufactured from the same material as the phase conductors.
- The motor earth must be connected to one of the Optidrive earth terminals.
- For compliance with the European EMC directive, a suitable screened (shielded) cable should be used. Braided or twisted type screened cable where the screen covers at least 85% of the cable surface area, designed with low impedance to HF signals are recommended as a minimum. Installation within a suitable steel or copper tube is generally also acceptable.
- The cable screen should be terminated at the motor end using an EMC type gland allowing connection to the motor body through the largest possible surface area
- Where drives are mounted in a steel control panel enclosure, the cable screen may be terminated directly to the control panel using a suitable EMC clamp or gland, as close to the drive as possible.
- For IP55 drives, connect the motor cable screen to the internal ground clamp

#### 4.6. Motor Terminal Box Connections

Most general purpose motors are wound for operation on dual voltage supplies. This is indicated on the nameplate of the motor

This operational voltage is normally selected when installing the motor by selecting either STAR or DELTA connection. STAR always gives the higher of the two voltage ratings.

Incoming Supply Voltage	Motor Nameplate Voltages		Connection		
230	230 / 400	Delta			
400	400 / 690	Della	000		
600	600 / 1050				
400	230 / 400				
600	340 / 600	Star			

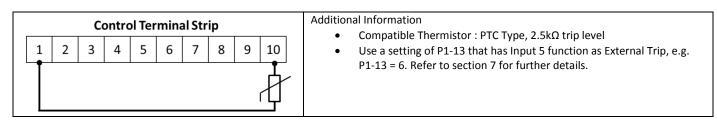

#### 4.7. Motor Thermal overload Protection.

#### 4.7.1. Internal Thermal overload protection.

The drive has an in-built motor thermal overload function; this is in the form of an "l.t-trP" trip after delivering >100% of the value set in P1-08 for a sustained period of time (e.g. 150% for 60 seconds).

#### 4.7.2. Motor Thermistor Connection

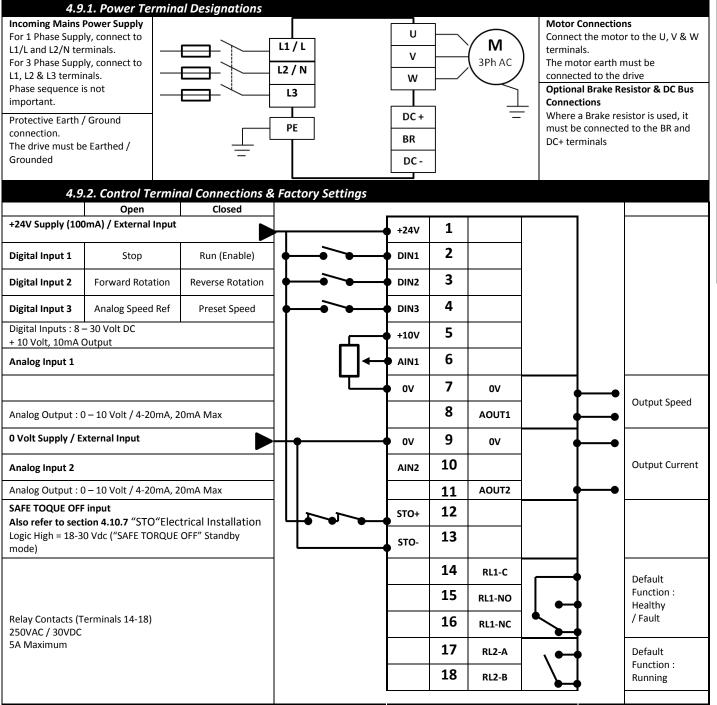

Where a motor thermistor is to be used, it should be connected as follows:-

#### 4.8. Control Terminal Wiring

- All analog signal cables should be suitably shielded. Twisted pair cables are recommended.
  - Power and Control Signal cables should be routed separately where possible, and must not be routed parallel to each other.
- Signal levels of different voltages e.g. 24 Volt DC and 110 Volt AC, should not be routed in the same cable.
- Maximum control terminal tightening torque is 0.5Nm.
- Control Cable entry conductor size: 0.05 2.5mm<sup>2</sup> / 30 12 AWG.

#### 4.9. Connection Diagram

#### 4.10. Safe Torque Off

Safe Torque OFF will be referred to as "STO" through the remainder of this section.

#### 4.10.1. Responsibilities

The overall system designer is responsible for defining the requirements of the overall "Safety Control System" within which the drive will be incorporated; furthermore the system designer is responsible for ensuring that the complete system is risk assessed and that the "Safety control System" requirements have been entirely met and that the function is fully verified, this must include confirmation testing of the "STO" function before drive commissioning.

The system designer shall determine the possible risks and hazards within the system by carrying out a thorough risk and hazard analysis, the outcome of the analysis should provide an estimate of the possible hazards, furthermore determine the risk levels and identify any needs for risk reduction. The "STO" function should be evaluated to ensure it can sufficiently meet the risk level required.

#### 4.10.2. What STO Provides

The purpose of the "STO" function is to provide a method of preventing the drive from creating torque in the motor in the absence of the "STO" input signals (Terminal 12 with respect to Terminal 13), this allows the drive to be incorporated into a complete safety control system where "STO" requirements need to be fulfilled.<sup>1</sup>

The "STO" function can typically eliminate the need for electro-mechanical contactors with cross-checking auxiliary contacts as per normally required to provide safety functions.<sup>2</sup>

The drive has the "STO" Function built-in as standard and complies with the definition of "Safe torque off" as defined by IEC 61800-5-2:2007. The "STO" Function also corresponds to an uncontrolled stop in accordance with category 0 (Emergency Off), of IEC 60204-1. This means that the motor will coast to a stop when the "STO" function is activated, this method of stopping should be confirmed as being acceptable to the system the motor is driving.

The "STO" function is recognised as a fail safe method even in the case where the "STO" signal is absent and a single fault within the drive has occurred, the drive has been proven in respect of this by meeting the following safety standards :

	SIL (Safety Integrity Level)	PFH <sub>D</sub> (Probability of dangerous Failures per Hour)	SFF (Safe failure fraction %)	Lifetime assumed
EN 61800-5-2	2	1.23E-09 1/h (0.12 % of SIL 2)	50	20 Yrs

	PL	CCF (%)
	(Performance level)	(Common Cause Failure)
EN ISO 13849-1	PL d	1

	SILCL
EN 62061	SILCL 2

Note : The values achieved above maybe jeopardised if the drive is installed outside of the Environmental limits detailed in section 10.1 "Environmental".

#### 4.10.3. What STO does not provide

Disconnect and ISOLATE the drive before attempting any work on it. The "STO" function does not prevent high voltages from being present at the drive power terminals.

<sup>1</sup>Note: The "STO" function does not prevent the drive from an unexpected re-start. As soon as the "STO" inputs receive the relevant signal it is possible (subject to parameter settings) to restart automatically, Based on this, the function should not be used for carrying out short-term non-electrical machinery operations (such as cleaning or maintenance work).

<sup>2</sup>Note: In some applications additional measures may be required to fulfil the systems safety function needs: the "STO" function does not provide motor braking. In the case where motor braking is required a time delay safety relay and/or a mechanical brake arrangement or similar method should be adopted, consideration should be made over the required safety function when braking

The drive braking circuit alone cannot be relied upon as a fail safe method.

When using permanent magnet motors and in the unlikely event of a multiple output power devices failing then the motor could effectively rotate the motor shaft by 180/p degrees (Where p denotes number of motor pole pairs).

#### 4.10.4. "STO" Operation

When the "STO" inputs are energised, the "STO" function is in a standby state, if the drive is then given a "Start signal/command" (as per the start source method selected in **P**1-13) then the drive will start and operate normally.

When the "STO" inputs are de-energised then the STO Function is activated and stops the drive (Motor will coast), the drive is now in "Safe Torque Off" mode.

To get the drive out of "Safe Torque Off" mode then any "Fault messages" need to be reset and the drive "STO" input needs to be re-energised.

#### 4.10.5. "STO" Status and Monitoring

There are a number of methods for monitoring the status of the "STO" input, these are detailed below:

#### Drive Display

In Normal drive operation (Mains AC power applied), when the drives "STO" input is de-energised ("STO" Function activated) the drive will highlight this by displaying "InHibit", (Note: If the drive is in a tripped condition then the relevant trip will be displayed and not "InHibit"). Drive Output Relay

- Drive relay 1: Setting P2-15 to a value of "13" will result in relay opening when the "STO" function is activated.
- Drive relay 2: Setting P2-18 to a value of "13" will result in relay opening when the "STO" function is activated.

#### "STO" Fault Codes

Fault Code	Code Number	Description	Corrective Action
"Sto-F"	29	A fault has been detected within either of the internal channels of the "STO" circuit.	Refer to your Invertek Sales Partner

#### 4.10.6. "STO" Function response time

The total response time is the time from a safety related event occurring to the components (sum of) within the system responding and becoming safe. (Stop Category 0 in accordance with IEC 60204-1)

- The response time from the "STO" inputs being de-energised to the output of the drive being in a state that will not produce torque in the motor ("STO" active) is less than 1ms.
- The response time from the "STO" inputs being de-energised to the "STO" monitoring status changing state is less than 20ms
- The response time from the drive sensing a fault in the STO circuit to the drive displaying the fault on the display/Digital output showing drive not healthy is less than 20ms.

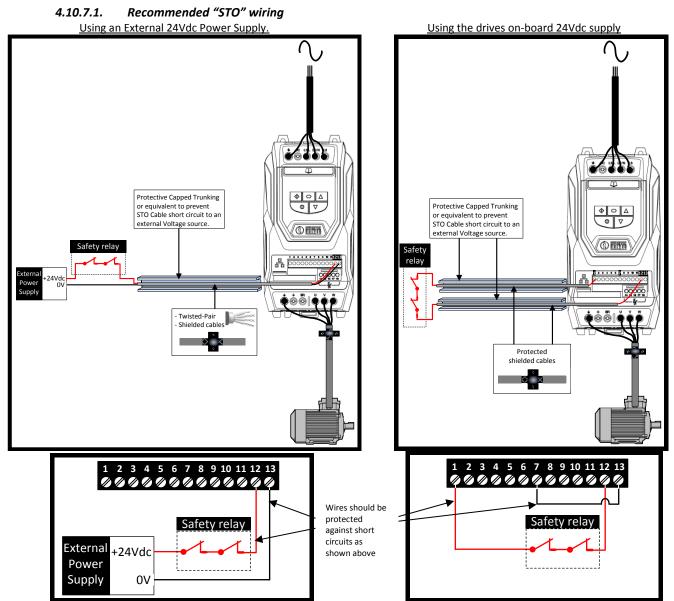

#### 4.10.7. "STO" Electrical Installation

The "STO" wiring shall be protected from inadvertent short circuits or tampering which could lead to failure of the "STO" input signal, further guidance is given in the diagrams below.

In addition to the wiring guidelines for the "STO" circuit below, section 4.1.1 Recommended installation for EMC compliance should also be followed.

The drive should be wired as illustrated below; the 24Vdc signal source applied to the "STO" input can be either from the 24Vdc on the drive or from an External 24Vdc power supply.

Note : The Maximum cable length from Voltage source to the drive terminals should not exceed 25 mtrs.

#### 4.10.8. External Power supply Specification.

Voltage Rating (Nominal)	24Vdc
STO Logic High	18-30Vdc (Safe torque off in standby)
Current Consumption (Maximum)	100mA

#### 4.10.9. Safety Relay Specification.

The safety relay should be chosen so that at minimum it meets the safety standards in which the drive meets.

SIL2 or PLd SC3 or better (With Forcibly guided Contacts)		
Number of Output Contacts	2 independent	
Switching Voltage Rating	30Vdc	
Switching Current	100mA	

#### 4.10.10. Enabling the "STO" Function

The "STO" function is always enabled in the drive regardless of operating mode or parameter changes made by the user.

#### 4.10.1. Testing the "STO" Function

Before commissioning the system the "STO" function should always be tested for correct operation, this should include the following tests:

- With the motor at standstill, and a stop command given to the drive (as per the start source method selected in P1-13):
   De-energise the "STO" inputs (Drive will display ""InHibit").
  - Give a start command (as per the start source method selected in P1-13) and check that the drive still displays "Inhibit" and that the operation is in line with the section 4.10.4 "STO" Operation and section 4.10.5 "STO" Status and Monitoring
- With the motor running normally (from the drive):
  - De-energise the "STO" inputs
  - Check that the drive displays "InHibit" and that the motor stops *and* that the operation is in line with the section *and section* 4.10.4 "STO" Operation and section 4.10.5 "STO" Status and Monitoring

#### 4.10.2. "STO" Function Maintenance.

The "STO" function should be included within the control systems scheduled maintenance program so that the function is regularly tested for integrity (Minimum once per Year), furthermore the function should be integrity tested following any safety system modifications or maintenance work.

If drive fault messages are observed refer to section 11.1"Fault messages" for further guidance.

#### 4.11. Connecting a Brake Resistor

Optidrive P2 units feature an internal brake transistor, fitted as standard for all frame Size 2 – 5 models, and optionally on larger frame sizes. The brake resistor should be connected to the DC+ and BR Terminals of the drive.

The brake transistor is enabled using P1-05 (Refer to section 8.1 for further information).

Software protection against brake resistor overload is carried out within the drive. For correct protection

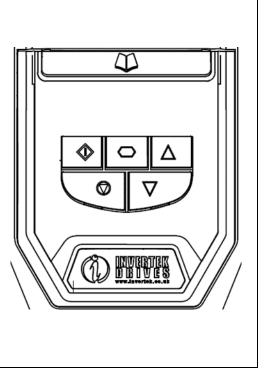

- Set P1-14 = 201
- Enter the resistance of the brake resistor in P6-19 (Ohms)
- Enter the power of the brake resistor in P6-20 (kW)

### ه 5. Managing the Keypad

The drive is configured and its operation monitored via the keypad and display.

#### 5.1. Keypad Layout and Function – Standard LED Keypad

	-	
	NAVIGATE	Used to display real-time information, to access and exit parameter edit mode and to store parameter changes
	UP	Used to increase speed in real-time mode or to increase parameter values in parameter edit mode
	DOWN	Used to decrease speed in real-time mode or to decrease parameter values in parameter edit mode
	RESET / STOP	Used to reset a tripped drive. When in Keypad mode is used to Stop a running drive.
$\diamondsuit$	START	When in keypad mode, used to Start a stopped drive or to reverse the direction of rotation if bi-directional keypad mode is enabled

#### 5.2. Changing Parameters

Procedure	Display shows
Power on Drive	StoP
Press and hold the for >2 seconds	P  - D
Press the Key	P I-02
The and can be used to select the desired parameter	P  - []] etc
Select the required parameter, e.g. P1-02	P I-02
Press the button	0.0
Use the walue, e.g. set to 10	10.0
Press the key	P I-02
The parameter value is now adjusted and automatically stored. Press the operating mode key for >2 seconds to return to	StoP

#### 5.3. Advanced Keypad Operation Short Cuts

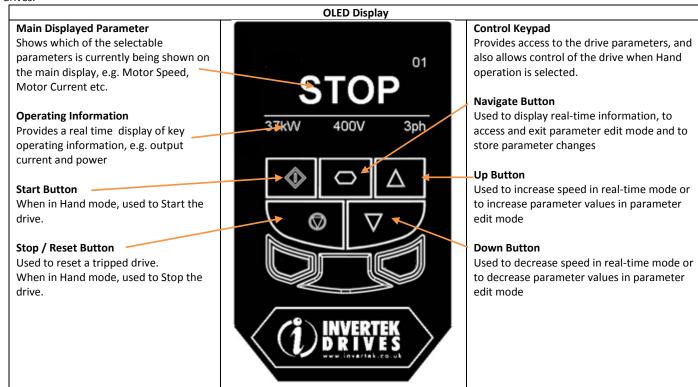

Function	When Display shows	Press	Result	Example
Fast Selection of Parameter Groups	₽ <sub>x⁻xx</sub>		The next highest Parameter group is selected	Display shows P I- ID Press + C Display shows P2-0 I
ote : Parameter Group ccess must be enabled P1-14 = 101	₽ <sub>x⁻xx</sub>		The next lowest Parameter group is selected	Display shows P2-26 Press + V Display shows P I-0 I
Select lowest Group Parameter	₽ <sub>x⁻xx</sub>		The first parameter of a group is selected	Display shows P I- ID Press P + P Display shows P I- D I
Set Parameter to minimum value	Any numerical value (Whilst editing a parameter value)		The parameter is set to the minimum value	When editing P1-01 Display shows <b>50.0</b> Press <b>Press - - - - - - - - - -</b>
djusting individual digits vithin a parameter value	Any numerical value (Whilst editing a parameter value)	<b>()</b> +	Individual parameter digits can be adjusted	When editing P1-10 Display shows Press Display shows Display shows Press Display shows Display sh

#### 5.4. Drive Operating Displays

Display	Status					
StoP	Drive mains power applied, but no Enable or Run signal applied					
AULo-L	Motor Autotune in progress.					
Н х.х	Drive running, display shows output frequency (Hz)	Whilst the drive is running, the following displays can be				
Я х.х	Drive running, display shows motor current (Amps)	selected by briefly pressing the button on the drive.				
Р х.х	Drive Running, display shows motor power (kW)	Each press of the button will cycle the display through to				
Е х.х	Drive Running, display shows customer selected units, see parameters P2-21 and P2-22	the next selection.				
Et1-24	Drive mains power not present, external 24 Volt control power supply present only					
I nh ibb	Output power hardware inhibited, hardware enable circuit open. External links are required to the STO inputs (terminals 12 and 13) as shown in section 4.9 Connection Diagram					
P-dEF	Parameters reset to factory default settings					
U- dEF	Parameters reset to User default settings					
For drive faul	t code displays, refer to section 11.1 on page 51					

#### 5.5. Keypad Layout and Function – Optional OLED Keypad

An optional Multi Language OLED display keypad may be specified at the time of order, option code –Tx. This option is not available for IP20 drives.

#### 5.6. Drive Operating Displays

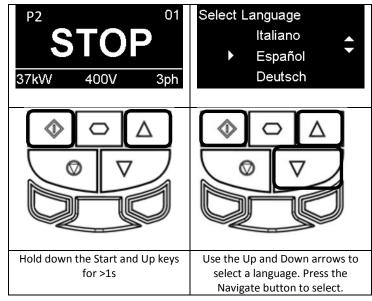

r		01			01	Output	Frequency 01	Under ∨oltage
IN	HIBI	Т	S	TO		н	23.7 Hz <sup>*</sup>	U-Volt
37kW	400V	3ph	37kW	400V	3ph	0.3A	0.02kW	Press STOP key to reset
	d when the hai ble circuit is op	when the hardware Displayed when the drive power			perating, display showing utput information	Drive trip display showing trip condition		

#### 5.7. Accessing and Changing Parameter Values

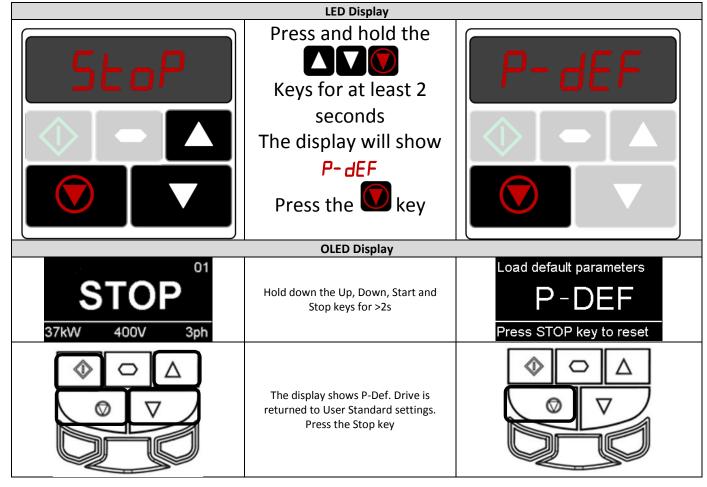

01 STOP 37kW 400V 3ph	Maximum speed limit P1-01 \$ 50.0Hz	50.0 Hz ≎	Maximum speed limit <b>23.7 Hz ≎</b> P1-01 ↑250.0 ↓0.0
$ \bigcirc \bigcirc \land \bigcirc \bigcirc \lor \bigcirc \bigcirc$			$ \bigcirc \bigcirc \bigcirc \\ \bigcirc \nabla \\ \bigcirc \nabla \\ \bigcirc \bigcirc \\ \bigcirc \bigcirc \\ \bigcirc \bigcirc \\ \bigcirc \\$
Hold navigate button in for >1 sec	Use up and down keys to scroll to required parameter.	Presss / release navigate button when required parameter shown	Use up and down keys to edit parameter value.

ഗ

#### 5.8. Changing the Language on the OLED Display

#### 5.9. Resetting Parameters to Factory Default Settings

#### 5.10. Terminal Control

When delivered, the Optidrive is in the factory default state, meaning that it is set to operate in terminal control mode and all parameters have the default values as indicated in section 6.

- Connect the drive to the supply, ensuring the correct voltage and fusing / circuit breaker protection see section 10.2.
- Connect the motor to the drive, ensuring the correct star/delta connection for the voltage rating see section 4.6.
- Apply the mains power to the drive, then enter the motor data from motor nameplate; P1-07 = motor rated voltage, P1-08 = motor rated current, P1-09 = motor rated frequency.
- Connect the Drive Hardware Enable (STO) circuit as follows
  - Link Terminal 1 to Terminals 12 (STO +)
    - $\circ$   $\,$  Link Terminal 9 to Terminal 13 (STO -)
- Connect a control switch between the control terminals 1 and 2 ensuring that the contact is open (drive disabled).
- Connect a potentiometer (1k $\Omega$  min to 10 k $\Omega$  max) between terminals 5 and 7, and the wiper to terminal 6.
- With the potentiometer set to zero, switch on the supply to the drive. The display will show **StoP**.
- Close the control switch, terminals 1-2. The drive is now 'enabled' and the output frequency/speed are controlled by the
- potentiometer. The display shows zero speed in Hz (H 0.0) with the potentiometer turned to minimum.
- Turn the potentiometer to maximum. The motor will accelerate to 50Hz, (60Hz for HP drives), the default value of P1-01, under the control of the acceleration ramp time P1-03.
- If the potentiometer is turned to minimum, the motor will decelerate to OHz, the default minimum speed set in P1-02, under the control of the deceleration ramp P1-04. The output speed can be adjusted anywhere between minimum and maximum speed using the potentiometer.
- To display motor current (Amps), briefly press the

again to display the motor power.

(Navigate) key.

Press

- Press again to return to speed display.
- To stop the motor, disable the drive by opening the control switch (terminals 1-2).
- If the enable/disable switch is opened the drive will decelerate to stop at which time the display will show **5toP**.

#### 5.11. Keypad Control

To allow the Optidrive to be controlled from the keypad in a forward direction only, set P1-12 =1:

- Connect the drive to the supply, ensuring the correct voltage and fusing / circuit breaker protection see section 10.2.
- Connect the motor to the drive, ensuring the correct star/delta connection for the voltage rating see section 4.6.
- Apply the mains power to the drive, then enter the motor data from motor nameplate; P1-07 = motor rated voltage, P1-08 = motor rated current, P1-09 = motor rated frequency.
- Connect the Drive Hardware Enable (STO) circuit as follows
  - Link Terminal 1 to Terminals 12 (STO +)
  - Link Terminal 9 to Terminal 13 (STO -)
- Connect a control switch between the control terminals 1 and 2 ensuring that the contact is open (drive disabled).
- Enable the drive by closing the switch between control terminals 1 & 2. The display will show **StoP**.
- Press the key. The display shows H 0.0.
- Press to increase speed.
- The drive will run forward, increasing speed until is released.
- Press to decrease speed. The drive will decrease speed until is released. The rate of deceleration is limited by the setting in P1-04
- Press the key. The drive will decelerate to rest at the rate set in P1-04.
- The display will finally show **5LoP** at which point the drive is disabled
- To preset a target speed prior to enable, press the key whilst the drive is stopped. The display will show the target speed, use the keys to adjust as required then press the key to return the display to 5LoP.
- Pressing the key will start the drive accelerating to the target speed.
- To allow the Optidrive to be controlled from the keypad in a forward and reverse direction, set P1-12 =2:
- Operation is the same as when P1-12=1 for start, stop and changing speed.
- Press the key. The display changes to H 0.0.
- Press **U** to increase speed
- The drive will run forward, increasing speed until speed is the speed set in P1-01.

is released. Acceleration is limited by the setting in P1-03. The maximum

#### 5.12. Operating in Sensorless Vector Speed Control Mode

To reverse the direction of rotation of the motor, press the

Optidrive P2 can be programmed by the user to operate in Sensorless Vector mode, which provides enhanced low speed torque, optimum motor speed regulation regardless of load and accurate control of the motor torque. In most applications, the default Voltage Vector control mode will provide adequate performance, however if Sensorless Vector operation is required, use the following procedure.

- Ensure advanced parameter access is enabled by setting P1-14 = 101
- Enter the motor nameplate details into the relevant parameters as follows
  - P1-07 Motor Rated Voltage
  - P1-08 Motor Rated Current
  - P1-09 Motor Rated Frequency
  - o (Optional) P1-10 Motor Rated Speed (Rpm)
  - o P4-05 Motor Power Factor
  - Select Sensorless Vector control mode by setting P4-01 = 0
- Ensure that the motor is correctly connected to the drive
- Carry out a motor data Autotune by setting P4-02 = 1

The Autotune will begin immediately when P4-02 is set regardless of the status of the drive enable signal. Whilst the autotune procedure does not drive or spin the motor, the motor shaft may still turn slightly. It is not normally necessary to uncouple the load from the motor; however the user should ensure that no risk arises from the possible movement of the motor shaft. It is essential that the correct motor data is entered into the relevant drive parameters. Incorrect parameter settings can result in poor or even dangerous performance.

#### 6. Parameters

#### 6.1. Parameter Set Overview

The Optidrive P2 Parameter set consists of 6 groups as follows:

- Group 0 Read Only Monitoring Parameters
- Group 1 Basic Configuration Parameters
- Group 2 Extended Parameters
- Group 3 PID Control Parameters
- Group 4 High Performance Motor Control Parameters
- Group 5 Field Bus Parameters

When the Optidrive is reset to factory defaults, or is in its factory supplied state, only Group 1 Parameters can be accessed. In order to allow access to parameters from the higher level groups, P1-14 must be set to the same value as P2-40 (Default setting = 101). With this setting, parameter groups 1 - 5 can be accessed, along with the first 38 parameters in Group 0.

#### 6.2. Parameter Group 1 – Basic Parameters

	Parameter Name	Minimum	Maximum	Default	Units				
P1-01	Maximum Frequency / Speed Limit	P1-02	500.0	50.0 (60.0)	Hz / Rpm				
	Maximum output frequency or motor speed limit – Hz or rpm.				-				
	If P1-10 >0, the value entered / displayed is in Rpm								
P1-02	Minimum Frequency / Speed Limit	0.0	P1-01	0.0	Hz / Rpm				
	Minimum speed limit – Hz or rpm.								
	If P1-10 >0, the value entered / displayed is in Rpm								
P1-03	Acceleration Ramp Time	See E	Below	5.0 / 10.0	Seconds				
	Acceleration ramp time from 0 to base speed (P-1-09) in seconds.	•							
	FS2 & FS3 : 5.0 Seconds Default Setting, 0.01 Seconds Resolution, 600.0 Seconds	onds Maximum	l						
	FS4 – FS7 : 10.0 Seconds Default Setting, 0.1 Seconds Resolution, 6000 Seconds	nds Maximum							
P1-04	Deceleration Ramp Time	See E	Below	5.0 / 10.0	Seconds				
	Deceleration ramp time from base speed (P1-09) to standstill in seconds. W	hen set to zero	, fastest possi	ible ramp time	without trip				
	is activated

The "Selected Speed Reference" referred to in the above table is determined by the value set in P1-12 (Control Mode) :

P1-12 (control Mode)	Selected Speed Reference
0 : Terminal Mode	Analog input 1
1 : Keypad Mode (uni-directional)	Digital Potentiometer
2 : Keypad Mode (bi-directional)	Digital Potentiometer
3 : User PID mode	PID controller output
4 : Fieldbus Control	Speed reference via Fieldbus
5 : Slave Mode	Speed reference via Optibus

#### Note

- 1) To access P8-11, set P1-14 = 201
- 2) If a motor thermistor (PTC type only, or normally closed thermal switch contact) is to be connected, this must be selected in P2-33. Connect the thermistor between terminal 1 and terminal 10.
- 3) When P1-12 = 0 and P 1-13 = 10 or 20, the Motorised Pot / Keypad reference is automatically selected to be the Selected Speed Reference

#### 8. Extended Parameters

 $\infty$ 

### 2 8.1. Parameter Group 2 - Extended parameters

Par	Parameter Name	Minimum	Maximum	Default	Units
P2-01	Preset / Jog Frequency / Speed 1	P1-02	P1-01	5.0	Hz / Rp
P2-01	Preset / Jog Frequency / Speed 1	P1-02 P1-02	P1-01	10.0	Hz / Rp
P2-02	Preset / Jog Frequency / Speed 2	P1-02 P1-02	P1-01	25.0	Hz / Rp
P2-04	Preset / Jog Frequency / Speed 4	P1-02	P1-01	50.0 (60.0)	Hz/Rp
P2-05	Preset / Jog Frequency / Speed 5	P1-02	P1-01	0.0	Hz/Rp
P2-06	Preset / Jog Frequency / Speed 6	P1-02	P1-01	0.0	Hz/Rp
P2-07	Preset / Jog Frequency / Speed 7	P1-02	P1-01	0.0	Hz / Rp
P2-08	Preset / Jog Frequency / Speed 8	P1-02	P1-01	0.0	Hz / Rp
	Preset Speeds / Frequencies selected by digital inputs depending on the setting of P1-13.				
	If P1-10 = 0, the values are entered as Hz. If P1-10 > 0, the val	ered as Rpm.			
	Setting a negative value will reverse the direction of motor rotation.				
P2-09	Skip Frequency Centre Point	P1-02	P1-01	0.0	Hz / Rp
P2-10	Skip Frequency Band Width	0.0	P1-01	0.0	Hz / Rp
	The Skip Frequency function is used to avoid the Optidrive operating at a				
	which causes mechanical resonance in a particular machine. Parameter P2-09 defines the centre point of the skip frequency band				
	and is used conjunction with P2-10. The Optidrive output frequency will r				
	and P1-04 respectively, and will not hold any output frequency within the		•		lied to the
	drive is within the band, the Optidrive output frequency will remain at th	e upper or low	er limit of the b	and.	
P2-11	Analog Output 1 (Terminal 8) Function Select	0	11	8	-
	Digital Output Mode. Logic 1 = +24V DC				
	<b>0 : Drive Enabled (Running)</b> . Logic 1 when the Optidrive is enabled (Running)				
	1: Drive Healthy. Logic 1 When no Fault condition exists on the drive				
	2 : At Target Frequency (Speed). Logic 1 when the output frequency matches the setpoint frequency				
	3 : Output Frequency > 0.0. Logic 1 when the motor runs above zero speed				
	4: Output Frequency >= Limit. Logic 1 when the motor speed exceeds the adjustable limit				
	5 : Output Current >= Limit. Logic 1 when the motor current exceeds the adjustable limit				
	6 : Motor Torque >= Limit. Logic when the motor torque exceeds the adjustable limit				
	7: Analog Input 2 Signal Level >= Limit. Logic when the signal applied to the Analog Input 2 exceeds the adjustable limit

P2-40	Extended Parameter Access Code Definition	0	9999	101	-			
12-40				101	-			
	Defines the access code which must be entered in P1-14 to access parameter groups above Group 1							

## 8.2. Parameter Group 3 – PID Control

Extended Parameters

Par	Parameter Name	Minimum	Maximum	Default	Units				
P3-01	PID Proportional Gain	0.1	30.0	1.0	-				
	PID Controller Proportional Gain. Higher values provide a greater change	in the drive out	out frequency	in response to	small				
	changes in the feedback signal. Too high a value can cause instability								
P3-02	PID Integral Time Constant	0.0	30.0	1.0	S				
	PID Controller Integral Time. Larger values provide a more damped respo	nse for systems	where the ove	rall process res	sponds				
	slowly								
P3-03	PID Differential Time Constant	0.00	1.00	0.00	S				
	PID Differential Time Constant								
P3-04	PID Operating Mode	0	1	0	-				
	0: Direct Operation. Use this mode if an increase in the motor speed sho	ould result in an i	ncrease in the	feedback signa	al				
	1: Inverse Operation. Use this mode if an increase in the motor speed sh	ould result in a	decrease in the	e feedback sign	al				
P3-05	PID Reference (Setpoint) Source Select	0	2	0	-				
	Selects the source for the PID Reference / Setpoint								
	0: Digital Preset Setpoint. P3-06 is used								
	1 : Analog Input 1 Setpoint								
	2 : Analog Input 2 Setpoint								
P3-06	PID Digital Reference (Setpoint)	0.0	100.0	0.0	%				
	When P3-05 = 0, this parameter sets the preset digital reference (setpoin	t) used for the P	ID Controller						
P3-07	PID Controller Output Upper Limit	P3-08	100.0	100.0	%				
	Limits the maximum value output from the PID controller								
P3-08	PID Controller Output Lower Limit	0.0	P3-07	0.0	%				
	Limits the minimum output from the PID controller								
P3-09	PID Output Limit Control	0	3	0	-				
	0: Digital Output Limits. The output range of the PID controller is limited	•							
	<b>1 : Analog Input 1 Provides a Variable Upper Limit</b> . The output range of the PID controller is limited by the values of P3-08 & the

	Modbus RTU specification, and is expressed as the number of additional of	naracters			

## 8.5. Parameter Group 0 – Monitoring Parameters (Read Only)

Par	Description	Units
P0-01	Analog Input 1 Applied Signal Level	%
	Displays the signal level applied to analog input 1 (Terminal 6) after scaling and offsets have been applied.	
P0-02	Analog Input 2 Applied Signal Level	%
	Displays the signal level applied to analog input 2 (Terminal 10) after scaling and offsets have been applied.	
P0-03	Digital Input Status	-
	Displays the status of the drive inputs, starting with the left hand side digit = Digital Input 1 etc.	
P0-04	Pre Ramp Speed Controller Reference	Hz
1004	Displays the set point reference input applied to the drive internal speed controller	112
P0-05	Torque Controller Reference	%
PU-05		70
<b>DO OC</b>	Displays the set point reference input applied to the drive internal torque controller	11-
P0-06	Digital Speed Reference (Motorised Pot)	Hz
	Displays the value of the drive internal Motorised Pot (used for keypad) speed reference	
P0-07	Fieldbus Communication Speed Reference	Hz
	Displays the setpoint being received by the drive from the currently active Fieldbus interface.	
P0-08	PID Reference (Setpoint)	%
	Displays the setpoint input to the PID controller.	
P0-09	PID Feedback Level	%
	Displays the Feedback input signal to the PID controller	
P0-10	PID Controller Output	%
	Displays the output level of the PID controller	
P0-11	Applied Motor Voltage	V
	Displays the instantaneous output voltage from the drive to the motor	-
P0-12	Output Torque	%
. 0-12		70
P0-13	Displays the instantaneous output torque level produced by the motor	_
P0-13	Trip History Log	-
	Displays the last four fault codes for the drive. Refer to section 11.1 for further information	-
P0-14	Motor Magnetising Current (Id)	A
	Displays the motor magnetising Current, providing an auto tune has been successfully completed.	
P0-15	Motor Rotor Current (Iq)	A
	Displays the motor Rotor (torque producing) current, providing an auto tune has been successfully completed.	•
P0-16	DC Bus Voltage Ripple Level	V
	Displays the level of ripple present on the DC Bus Voltage. This parameter is used by the Optidrive for various inter	nal protection
	and monitoring functions.	
P0-17	Motor Stator resistance (Rs)	Ω
	Displays the measured motor stator resistance, providing an auto tune has been successfully completed.	
P0-18	Motor Stator Inductance (Ls)	Н
	Displays the measured motor stator inductance, providing an auto tune has been successfully completed.	
P0-19	Motor Rotor Resistance (Rr)	Ohms
	Displays the measured motor rotor resistance, providing an auto tune has been successfully completed.	
P0-20	DC Bus Voltage	V
10-20	Displays the instantaneous DC Bus Voltage internally within the drive	v
P0-21		°C
PU-21	Drive Temperature	L
D0 00	Displays the Instantaneous Heatsink Temperature measured by the drive	
P0-22	Time Remaining to next service	V
	Displays the number of hours remaining on the service time counter before the next service is due.	
P0-23	Operating Time Accumulated With Heatsink Temperature Above 80°C	HH:MM:SS
	Displays the amount of time in hours and minutes that the Optidrive has operated for during its lifetime with a hea	
	temperature in excess of 80°C. This parameter is used by the Optidrive for various internal protection and monitor	ing functions.
P0-24	Operating Time Accumulated With Ambient Temperature Above 80°C	HH:MM:SS
	Displays the amount of time in hours and minutes that the Optidrive has operated for during its lifetime with an a	nbient
	temperature in excess of 80°C. This parameter is used by the Optidrive for various internal protection and monitor	
P0-25	Rotor Speed (Estimated or Measured)	-
	In Vector control mode, this parameter displays either the estimated rotor speed of the motor, if no encoder feed	back is
	present, or the measured rotor speed if an optional Encoder Feedback Interface Option is fitted.	-
P0-26	Energy Consumption kWh Meter	kWh
	Displays the amount of energy consumed by the drive in kWh. When the value reaches 1000, it is reset back to 0.0	
	of PO-27 (*MWh meter) is increased.	, and the value
P0-27		N/\\/b
ru-2/	Energy Consumption MWh Meter	MWh
	Displays the amount of energy consumed by the drive in MWh.	
<b>DA</b> 45		
P0-28	Software Version and Checksum	-
	Displays the software version of the drive	-
P0-28 P0-29	Displays the software version of the drive Drive Type	-
P0-29	Displays the software version of the drive Drive Type Displays the type details of the drive	1
	Displays the software version of the drive Drive Type	1

Par	Description	Units
P0-31	Drive Lifetime Operating Time	HH:MM:SS
	Displays the total operating time of the drive. The first value shown is the number of hours. Pressing the Up key wil	display the
	minutes and seconds.	
P0-32	Drive Run Time Since Last Trip (1)	HH:MM:SS
	Displays the total operating time of the drive since the last fault occurred. The first value shown is the number of he	ours. Pressing
	the Up key will display the minutes and seconds.	
P0-33	Drive Run time Since Last Trip (2)	HH:MM:SS
	Displays the total operating time of the drive since the last fault occurred. The first value shown is the number of he	ours. Pressing
	the Up key will display the minutes and seconds.	
P0-34	Drive Run Time Since Last Disable	HH:MM:SS
	Displays the total operating time of the drive since the last Run command was received. The first value shown is the	number of
	hours. Pressing the Up key will display the minutes and seconds.	
P0-35	Drive Internal Cooling Fan Total Operating Time	HH:MM:SS
	Displays the total operating time of the Optidrive internal cooling fans. The first value shown is the number of hour	s. Pressing
	the Up key will display the minutes and seconds. This is used for scheduled maintenance information	
P0-36	DC Bus Voltage Log (256ms)	V
P0-37	DC Bus Voltage Ripple Log (20ms)	V
P0-38	Heatsink Temperature Log (30s)	°C
P0-39	Ambient Temperature Log (30s)	°C
P0-40	Motor Current Log (256ms)	А
	The above parameters are used to store the history of various measured levels within the drive at various regular ti	
	prior to a trip. The values are frozen when a fault occurs and can be used for diagnostic purposes – see section for f	urther
	information.	
P0-41	Critical Fault Counter – Over Current	-
P0-42	Critical fault counter – Over Voltage	-
P0-43	Critical fault counter – Under Voltage	-
P0-44	Critical fault counter – Over Temperature	-
P0-45	Critical fault counter – Brake Transistor Over Current	-
P0-46	Critical fault counter – Ambient Over Temperature	-
	These parameters contain a record of how many times certain critical faults have occurred during a drives operating	g lifetime.
	This provides useful diagnostic data	
P0-47	Reserved	-
	Reserved Parameter	
P0-48	Reserved	-
	Reserved Parameter	
P0-49	Modbus RTU Communication Error Counter	-
	This parameter is incremented every time an error occurs on the Modbus RTU communication link. This information	າ can be used
	for diagnostic purposes.	
P0-50	CAN Open Communication Error Counter	-
	This parameter is incremented every time an error occurs on the CAN Open communication link. This information c	an be used
	for diagnostic purposes.	

00

## 9. Serial communications

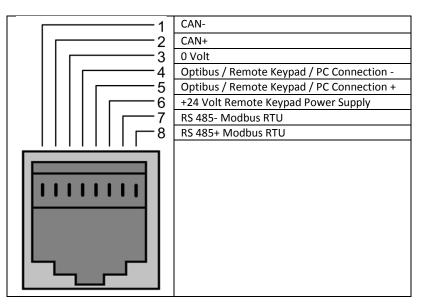

## 9.1. RJ45 Connector Pin Assignment

Optidrive P2 has an RJ45 connector on the front of the control panel. This connector allows the user to set up a drive network via a wired connection. The connector contains multiple interfaces for different communication protocols:-

- Invertek's Optibus Protocol Used for PC and peripheral connection only
- Modbus RTU
- CANBus

The Optibus connection is always available, and can be used simultaneously with other interfaces, however only one other interface may be used, e.g. If Modbus RTU is in use, CAN is disabled. If a Fieldbus Option Module (E.g. Profibus) is inserted into the drive, both Modbus and CAN are disabled.

The electrical signal arrangement of the RJ45 connector is shown as follows:

#### 9.2. Modbus RTU Communications

#### 9.2.1. Modbus Telegram Structure

The Optidrive P2 supports Master / Slave Modbus RTU communications, using the 03 Read Holding Registers and 06 Write Single Holding Register commands. Many Master devices treat the first Register address as Register 0; therefore it may be necessary to convert the Register Numbers detail in section 0 by subtracting 1 to obtain the correct Register address. The telegram structure is as follows:-

Command 03 – Read Holding Registers						
Master Telegram	Length			Slave Response	L	ength
Slave Address	1	Byte		Slave Address	1	Byte
Function Code (03)	1	Byte	1	Function Code (03)	1	Byte
1 <sup>st</sup> Register Address	2	Bytes	1	Byte Count	1	Byte
No. Of Registers	2	Bytes		1 <sup>st</sup> Register Value	2	Bytes
CRC Checksum	2	Bytes	1	2 <sup>nd</sup> Register Value	2	Bytes
				Etc		
				CRC Checksum	2	Bytes

Command 06 – Write Single Holding Register						
Master Telegram	Length			Slave Response	L	ength
Slave Address	1	Byte		Slave Address	1	Byte
Function Code (06)	1	Byte	1	Function Code (06)	1	Byte
Register Address	2	Bytes		Register Address	2	Bytes
Value	2	Bytes	1	Register Value	2	Bytes
CRC Checksum	2	Bytes		CRC Checksum	2	Bytes

#### 9.2.2. Modbus Control & Monitoring Registers

The following is a list of accessible Modbus Registers available in the Optidrive P2.

- When Modbus RTU is configured as the Fieldbus option, all of the listed registers can be accessed.
- Registers 1 and 2 can be used to control the drive providing that Modbus RTU is selected as the primary command source (P1-12 = 4) and no Fieldbus Option Module is installed in the drive Option Slot.
  - Register 3 can be used to control the output torque level providing that
    - The drive is operating in Vector Speed or Vector Torque motor control modes (P4-01 = 1 or 2)
    - The torque controller reference / limit is set for 'Fieldbus' (P4-06 = 3)
- Register 4 can be used to control the acceleration and deceleration rate of the drive providing that Fieldbus Ramp Control is enabled (P5-07 = 1)

#### • Registers 6 to 24 can be read regardless of the setting of P1-12

Register	Upper	Lower	Read	Notes
Number	Byte	Byte	Write	
	Command Co	ntrol Word	R/W	Command control word used to control the Optidrive when operating with Modbus
				RTU. The Control Word bit functions are as follows :-
				Bit 0 : Run/Stop command. Set to 1 to enable the drive. Set to 0 to stop the drive.
1				Bit 1 : Fast stop request. Set to 1 to enable drive to stop with 2 <sup>nd</sup> deceleration ramp.
				Bit 2 : Reset request. Set to 1 in order to reset any active faults or trips on the drive.
				This bit must be reset to zero once the fault has been cleared.
				Bit 3 : Coast stop request. Set to 1 to issue a coast stop command.
2	Command Spe	eed Reference	R/W	Setpoint must be sent to the drive in Hz to one decimal place, e.g. 500 = 50.0Hz
3		rque Reference	R/W	Setpoint must be sent to the drive in % to one decimal place, e.g. 2000 = 200.0%
	Command Ra	mp times	R/W	This register specifies the drive acceleration and deceleration ramp times used when
4				Fieldbus Ramp Control is selected (P5-08 = 1) irrespective of the setting of P1-12.
		•		The input data range is from 0 to 60000 (0.00s to 600.00s)
	Error code	Drive status	R	This register contains 2 bytes.
				The Lower Byte contains an 8 bit drive status word as follows :-
				Bit 0 : 0 = Drive Disabled (Stopped), 1 = Drive Enabled (Running)
				Bit 1 : 0 = Drive Healthy, 1 = Drive Tripped
				Bit 2 : No Function
				Bit 3 : Drive Ready, 1 = Drive Inhibit
6				Bit 4 : Maintenance Time Not Reached, 1 = Maintenance Time Reached
				Bit 5 : 0 = Not In Standby (Sleep), 1 = Standby (Sleep) mode active
				Bit 6 : No function
				Bit 7 : No Function
				Bit 8 : No Function
				The Upper Byte will contain the relevant fault number in the event of a drive trip.
	0.1.1.1.5			Refer to section 11.1 for a list of fault codes and diagnostic information
7	Output Frequ		R	Output frequency of the drive to one decimal place, e.g. 123 = 12.3 Hz
8	Output Curre		R	Output current of the drive to one decimal place, e.g. 105 = 10.5 Amps
9	Output Torqu		R	Motor output torque level to one decimal place, e.g. 474 = 47.4 %
10	Output Power		R	Output power of the drive to two decimal places, e.g. 1100 = 11.00 kW
11	Digital Input S		R	Represents the status of the drive inputs where Bit 0 = Digital Input 1 etc.
20	Analog 1 Leve		R	Analog Input 1 Applied Signal level in % to one decimal place, e.g. 1000 = 100.0%
21	Analog 2 Leve		R	Analog Input 2 Applied Signal level in % to one decimal place, e.g. 1000 = 100.0%
22	Pre Ramp Spe		R	Internal drive frequency setpoint
23	DC bus voltag		R	Measured DC Bus Voltage in Volts
24	Drive tempera	ature	R	Measured Heatsink Temperature in °C

#### 9.2.3. Modbus Parameter Access

All User Adjustable parameters (Groups 1 to 5) are accessible by Modbus, except those that would directly affect the Modbus communications, e.g.

- P5-01 Drive Fieldbus Address
- P5-03 Modbus RTU Baud Rate
- P5-04 Modbus RTU Data Format

All parameter values can be read from the drive and written to, depending on the operating mode of the drive – some parameters cannot be changed whilst the drive is enabled for example.

When accessing a drive parameter via Modbus, the Register number for the parameter is the same as the parameter number. Some parameters are internally scaled, for further information refer to the Optidrive P2 Modbus Register Map Application Note, or Advanced User Guide. E.g. Parameter P1-03 = Modbus Holding Register 103.

Since Modbus RTU supports sixteen bit integer values only, and the parameter is adjustable to one decimal place, the register value will be multiplied by a factor of ten,

E.g. Read Value of P1-03 = 50, therefore this is 5.0 seconds.

## **10.Technical Data**

## 10.1. Environmental

Ambient temperature range: Operational	: -10 50°C IP20 Units
	: - 10 40°C IP55 Units (UL Approved)
	: -10 50°C IP55 Units (Non UL Approved with derating, refer to section 10.4.1 for
	Derating for Ambient Temperature Information)
	- 10 40°C IP66 Units (UL Approved)
	: -10 50°C IP66 Units (Non UL Approved with derating, refer to section 10.4.1 for
	Derating for Ambient Temperature Information)
Storage and Transportation	: -40 °C 60 °C
Max altitude for rated operation	: 1000m (Refer to section 10.4.2 for Derating for Altitude Information)
Relative Humidity	: < 95% (non condensing)
Note : Drive must be Frost and moisture free	at all times
Installation above 2000m is not UL ap	proved

#### 10.2. Input / Output Power and Current ratings

The following tables provide the output current rating information for the various Optidrive P2 models. Invertek Drives always recommend that selection of the correct Optidrive is based upon the motor full load *current* at the incoming supply voltage.

10.2.1. 200 – 240 Volt (+/- 10%), 1 Phase Input, 3 Phase Output

Frame Size	Power	Rating	Input Current A	Fuse or MC		Maximum Cable Size		Rated Output Current		Motor Cable gth	Recommended Brake Resistance
	kW	HP		Non UL	UL	mm	AWG/kcmil	А	m	ft	Ω
	kW	HP	А	Non UL	UL	mm	AWG / kcmil	А	m	ft	Ω
2	0.75	1	8.5	10	15	8	8	4.3	100	330	100
2	1.5	1.5	15.2	25	20	8	8	7	100	330	50
2	2.2	1.5	19.5	25	25	8	8	10.5	100	330	35

#### Note

• Ratings shown above apply to 40°C Ambient temperature. For derating information, refer to section 10.4.1

- The maximum motor cable length stated applies to using a shielded motor cable. When using an unshielded cable, the maximum cable length limit may be increased by 50%. When using the Invertek Drives recommended output choke, the maximum cable length may be increased by 100%
- The PWM output switching from any inverter when used with a long motor cable length can cause an increase in the voltage at the motor terminals, depending on the motor cable length and inductance. The rise time and peak voltage can affect the service life of the motor. Invertek Drives recommend using an output choke for motor cable lengths of 50m or more to ensure good motor service life
  - For UL compliant installation, use Copper wire with a minimum insulation temperature rating of 70°C, UL Class CC or Class J Fuses

#### 10.2.2. 200 – 240 Volt (+/- 10%), 3 Phase Input, 3 Phase Output

	10.2.2. 200 – 240 Volt (+/- 10%), 3 Phase input, 3 Phase Output										
Frame Size	Power Rating		Input Current A	Fuse or M	CB (Type B)	Maximum	Cable Size	Rated Output Current	Maximum M Len	Motor Cable gth	Recommended Brake Resistance
	kW	HP		Non UL	UL	mm	AWG/kcmil	A	m	ft	Ω
2	0.75	1	5.1	10	10	8	8	4.3	100	330	100
2	1.5	2	8.3	10	15	8	8	7	100	330	50
2	2.2	3	12.6	16	17.5	8	8	10.5	100	330	35
3	4	5	21.6	25	30	8	8	18	100	330	20
3	5.5	7.5	29.1	40	40	8	8	24	100	330	20
4	7.5	10	36.4	50	50	16	5	30	100	330	22
4	11	15	55.8	63	70	16	5	46	100	330	22
5	15	20	70.2	80	90	35	2	61	100	330	12
5	18.5	25	82.9	100	110	35	2	72	100	330	12
6	22	30	103.6	125	150	150	300MCM	90	100	330	6
6	30	40	126.7	160	175	150	300MCM	110	100	330	6
6	37	50	172.7	200	225	150	300MCM	150	100	330	6
6	45	50	183.3	250	250	150	300MCM	180	100	330	6
7	55	50	205.7	250	300	150	300MCM	202	100	330	6
7	75	50	255.5	315	350	150	300MCM	248	100	330	6

#### Note

- Ratings shown above apply to 40°C Ambient temperature. For derating information, refer to section 10.4.1
- Operation with single phase supply is possible, with 50% derating of the output current capacity
- The maximum motor cable length stated applies to using a shielded motor cable. When using an unshielded cable, the maximum cable length limit may be increased by 50%. When using the Invertek Drives recommended output choke, the maximum cable length may be increased by 100%
- The PWM output switching from any inverter when used with a long motor cable length can cause an increase in the voltage at the motor terminals, depending on the motor cable length and inductance. The rise time and peak voltage can affect the service life of the motor. Invertek Drives recommend using an output choke for motor cable lengths of 50m or more to ensure good motor service life
- For UL compliant installation, use Copper wire with a minimum insulation temperature rating of 70°C, UL Class CC or Class J Fuses

## 10.3. Additional Information for UL Approved Installations

Optidrive P2 is designed to meet the UL requirements. In order to ensure full compliance, the following must be fully observed.

Input Power Supply Requirements							
Supply Voltage	200 - 240 RMS Volts for 23	0 Volt rated units, + /-	10% variation allowed. 2	240 Volt RMS Maximum			
	380 – 480 Volts for 400 Volt rated units, + / - 10% variation allowed, Maximum 500 Volts RMS						
	500 - 600 Volts for 600 Vol	t rated units, + / - 10%	variation allowed, Maxir	mum 600 Volts RMS			
Imbalance	Maximum 3% voltage varia	tion between phase –	phase voltages allowed				
	All Optidrive P2 units have	phase imbalance moni	toring. A phase imbaland	ce of > 3% will result in the drive tripping.			
	For input supplies which ha	ave supply imbalance g	reater than 3% (typically	the Indian sub- continent & parts of Asia			
	Pacific including China) Inve	ertek Drives recommer	nds the installation of inp	out line reactors. Alternatively, the drives			
	can be operated as a single phase supply drive with 50% derating.						
Frequency	50 – 60Hz + / - 5% Variation	<u>n</u>					
Short Circuit Capacity	Voltage Rating	Min kW (HP)	Max kW (HP)	Maximum supply short-circuit current			
	All	All	All	100kA rms (AC)			
	All the drives in the above table are suitable for use on a circuit capable of delivering not more than the above						
	specified maximum short-c	ircuit Amperes symme	trical with the specified	maximum supply voltage.			
Incoming power supply	y connection must be accordi	ing to section 4.3					
All Optidrive P2 units a	re intended for indoor install	lation within controlled	d environments which me	eet the condition limits shown in section			
10.1							
Branch circuit protection	on must be installed accordin	ig to the relevant natio	nal codes. Fuse ratings a	nd types are shown in section 10.2			
Suitable Power and mo	otor cables should be selected	d according to the data	shown in section 10.2				
Power cable connectio	ns and tightening torques are	e shown in section 3.4					
Optidrive P2 provides r	motor overload protection in	accordance with the N	Iational Electrical Code (	US).			
Where a mot	or thermistor is not fitted, or	r not utilised, Thermal	Overload Memory Reten	tion must be enabled by setting P4-12 = 1			
Where a mot	or thermistor is fitted and co	onnected to the drive, o	connection must be carri	ed out according to the information			

• Where a motor thermistor is fitted and connected to the drive, connection must be carried out according shown in section 4.7

## 10.4. Derating Information

Derating of the drive maximum continuous output current capacity is require when

- Operating at ambient temperature in excess of 40°C / 104°F for enclosed drives (non UL approved)
- Operating at Altitude in excess of 1000m/ 3281 ft
- Operation with Effective Switching Frequency higher than the minimum setting
- The following derating factors should be applied when operating drives outside of these conditions

#### 10.4.1. Derating for Ambient Temperature

Enclosure Type	Maximum Temperature Without Derating (UL Approved)	Derate by	Maximum Permissable Operating Ambient Temperature with Derating (Non UL Approved)
IP20	50°C / 122°F	N/A	50°C
IP55	40°C / 104°F	1.5% per °C (1.8°F)	50°C
IP66	40°C / 104°F	2.5% per °C (1.8°F)	50°C

#### 10.4.2. Derating for Altitude

Enclosure Type	Maximum Altitude Without Derating	Derate by	Maximum Permssable (UL Approved)	Maximum Permssable (Non-UL Approved)
IP20	1000m / 3281ft	1% per 100m / 328 ft	2000m / 6562 ft	4000m / 13123 ft
IP55	1000m / 3281ft	1% per 100m / 328 ft	2000m / 6562 ft	4000m / 13123 ft
IP66	1000m / 3281ft	1% per 100m / 328 ft	2000m / 6562 ft	4000m / 13123 ft

#### 10.4.3. Derating for Swicthing Frequency

		Switching Frequency (Where available)					
Enclosure Type	4kHz	8kHz	12kHz	16kHz	24kHz	32kHz	
IP20	N/A	N/A	20%	30%	40%	50%	
IP55	N/A	10%	10%	15%	25%	N/A	
IP66	N/A	10%	25%	35%	50%	50%	

#### 10.4.4. Example of applying Derating Factors

A 4kW, IP66 drive is to be used at an altitude of 2000 metres above sea level, with 12kHz switching frequency and 45°C ambient temperature. From the table above, we can see that the rated current of the drive is 9.5 Amps at 40°C,

Firstly, apply the switching frequency derating, 12kHz, 25% derating

9.5 Amps x 75% = 7.1 Amps

Now, apply the derating for higher ambient temperature, 2.5% per °C above 40°C = 5 x 2.5% = 12.5%

7.1 Amps x 87.5% = 6.2 Amps

Now apply the derating for altitude above 1000 metres, 1% per 100m above 1000m =  $10 \times 1\% = 10\%$ 

7.9 Amps x 90% = 5.5 Amps continuous current available.

If the required motor current exceeds this level, it will be necessary to either

- Reduce the switching frequency selected

- Use a higher power rated drive and repeat the calculation to ensure sufficient output current is available.

## 11. Troubleshooting

## 11.1. Fault messages

Fault Code	No.	Description	Corrective Action
no-FLt	00	No Fault	Displayed in P0-13 if no faults are recorded in the log
0I - 6	01	Brake channel over current	Ensure the connected brake resistor is above the minimum permissible level for the drive – refer to the ratings shown in section 10.2.
			Check the brake resistor and wiring for possible short circuits.
OL-br	02	Brake resistor overload	The drive software has determined that the brake resistor is overloaded, and trips to protect
			the resistor. Always ensure the brake resistor is being operated within its designed parameter before making any parameter or system changes.
			To reduce the load on the resistor, increase deceleration the time, reduce the load inertia or
			add further brake resistors in parallel, observing the minimum resistance value for the drive
	03	Instantaneous over current on drive	in use. Fault Occurs on Drive Enable
0-1	05	output.	Check the motor and motor connection cable for phase – phase and phase – earth short
		Excess load on the motor.	circuits.
			Check the load mechanically for a jam, blockage or stalled condition Ensure the motor nameplate parameters are correctly entered, P1-07, P1-08, P1-09.
			If operating in Vector mode (P4-01 – 0 or 1), also check the motor power factor in P4-05 and
			ensure an autotune has been successfully completed for the connected motor.
			Reduced the Boost voltage setting in P1-11 Increase the ramp up time in P1-03
			If the connected motor has a holding brake, ensure the brake is correctly connected and
			controlled, and is releasing correctly
			Fault Occurs When Running If operating in Vector mode (P4-01 – 0 or 1), reduce the speed loop gain in P4-03
I.E-ErP	04	Drive has tripped on overload after	Check to see when the decimal points are flashing (drive in overload) and either increase
		delivering >100% of value in P1-08 for	acceleration rate or reduce the load.
		a period of time.	Check motor cable length is within the limit specified for the relevant drive in section 10.2 Ensure the motor nameplate parameters are correctly entered in P1-07, P1-08, and P1-09
			If operating in Vector mode (P4-01 – 0 or 1), also check the motor power factor in P4-05 and
			ensure an autotune has been successfully completed for the connected motor.
			Check the load mechanically to ensure it is free, and that no jams, blockages or other mechanical faults exist
P5-ErP	05	Hardware Over Current	Check the wiring to motor and the motor for phase to phase and phase to earth short
, , ,			circuits. Disconnect the motor and motor cable and retest. If the drive trips with no motor
			connected, it must be replaced and the system fully checked and retested before a replacement unit is installed.
0-uort	06	Over voltage on DC bus	The value of the DC Bus Voltage can be displayed in P0-20
			A historical log is stored at 256ms intervals prior to a trip in parameter P0-36
			This fault is generally caused by excessive regenerative energy being transferred from the
			load back to the drive. When a high inertia or over hauling type load is connected. If the fault occurs on stopping or during deceleration, increase the deceleration ramp time
			P1-04 or connect a suitable brake resistor to the drive.
			If operating in Vector Mode, reduce the speed loop gain P4-03 If operating in PID control, ensure that ramps are active by reducing P3-11
U-uort	07	Under voltage on DC bus	This occurs routinely when power is switched off.
0 0022			If it occurs during running, check the incoming supply voltage, and all connections into the
	08	Heatsink over temperature	drive, fuses, contactors etc. The heatsink temperature can be displayed in P0-21.
0-E	00	neutonik over temperature	A historical log is stored at 30 second intervals prior to a trip in parameter P0-38
			Check the drive ambient temperature
			Ensure the drive internal cooling fan is operating Ensure that the required space around the drive as shown in sections 3.5 to 3.9 has been
			observed, and that the cooling airflow path to and from the drive is not restricted
			Reduce the effective switching frequency setting in parameter P2-24
U-E	09	Under temperature	Reduce the load on the motor / drive Trip occurs when ambient temperature is less than -10°C. The temperature must be raised
			over -10°C in order to start the drive.
P-dEF	10	Factory Default parameters have been loaded	Press STOP key, the drive is now ready to be configured for the required application
E-Er iP	11	External trip	E-trip requested on control input terminals. Some settings of P1-13 require a normally closed
			contactor to provide an external means of tripping the drive in the event that an external
	12	Communications Fault	device develops a fault. If a motor thermistor is connected check if the motor is too hot. Communications lost with PC or remote keypad. Check the cables and connections to
SC-065			external devices
FLE-dc	13	Excessive DC Ripple	The DC Bus Ripple Voltage level can be displayed in parameter P0-16
			A historical log is stored at 20ms intervals prior to a trip in parameter P0-37 Check all three supply phases are present and within the 3% supply voltage level imbalance
			tolerance.
			Reduce the motor load
P-LoSS	14	Input phase loss trip	If the fault persists, contact your local Invertek Drives Sales Partner Drive intended for use with a 3 phase supply, one input phase has been disconnected or lost.
h 0-1	15	Instantaneous over current on drive	Refer to fault 3 above
		output.
