## ROBA-stop ${ }^{\circledR}$-M

## Electromagnetic

## safety brakes

CR108927

## Your Reliable Brake

## Advantages for Your Applications

- Simple installation
- Brake outer diameter completely enclosed (higher protection can easily be realised)
- Magnetic coil is designed for a relative duty cycle of $100 \%$
- Magnetic coil and casting compound correspond to class of insulation F
- The nominal air gap is specified by design and inspected
- Short switching times
- Maintenance-free over the entire service lifetime of the rotor

Certain ROBA-stop ${ }^{\circledR}$-M brakes can be used for safety-relevant applications acc. ISO 13849-1 (for Permitted Types, see page 26).
For information on the safety parameters, please contact mayr ${ }^{\circledR}$ power transmission.

## Function

ROBA-stop ${ }^{\circledR}-\mathrm{M}$ brakes are spring applied, electromagnetic safety brakes.

Spring applied function:
In de-energised condition, helical springs (6) press against the armature disk(5). Therotor (3) is held between the armature disk (5) and the corresponding mounting surface of the machine. The shaft is braked via the toothed hub (1).

Electromagnetic:
When the power is switched on, a magnetic field is built up. The armature disk (5) is attracted to the coil carrier (2) against the spring pressure. The brake is released and the shaft is able to rotate freely.

Safety brakes:
The brake brakes reliably and safely in the event of a power switchoff, a power failure or an EMERGENCY STOP.

## Order Number

Example: 16 / 891.211.0 / 24 / 16 / 6885/1

1) Hand release not installed on size 2 - size 500 . Size 1000: Hand release only available as emergency hand release. Hand release for IP65 design only ex works.
2) On request
3) From size 60
4) Up to size 32 (for brake operation in hoisting device drives, please contact the manufacturer)
5) Not in combination with friction disk

For Further Options, see page 10.
6) See Technical Explanations pages 6-7
7) Sizes $2-60$
8) Standard tacho brake flange plate
9) Brake operation only possible with overexcitation on size 500 from 700 Nm onwards and on size 1000.
10) Not possible on size 1000.
11) Standard and tacho design are identical on size 1000. Order number for standard (tacho design) on size 1000: 1000/891._ _ 2 / _ / _ / _

ROBA-stop ${ }^{\circledR}-M$ safety brakes are also available in ATEX design according to the directive 94/9 EC (ATEX 95). (Please contact the manufacturer separately for this).

On request ROBA-stop ${ }^{\circledR}$ safety brakes can also be delivered with UL approval.

Standard voltages 24; 104; 180; 207 V.
Permitted voltage tolerance acc. DIN IEC 60038 ( $\pm 10 \%$ ).

1) Braking torque tolerance on size $2-250=+30 \% /-10 \%$, for other adjustments see Table 3, page 7 and type key page 3.
1.1) Braking torque tolerance $=+40 \% /-20 \%$ (friction lining pairing conditioning necessary, see Operational Instructions B.8.1._).
1.2) Minimum bore not permitted for braking torque adjustment $=125 \%$.
2) The respective maximum bores are to be seen in relation to the corresponding keyways and their tolerances acc. Table 2 page 7.
3) Hub facing side (both sides) 3 mm deep, $\varnothing 97$ recessed.

We reserve the right to make dimensional and constructional alterations.
4) Brake operation only possible with overexcitation
5) The IP65 design is equipped with a sealing cover on size 1000: $L=149$ $\mathrm{mm}, \mathrm{L}_{4}=170 \mathrm{~mm}$.
6) Projection screw plugs (emergency hand release): 8.5 mm
7) For flange plate securement: additional $2 \times \mathrm{M} 12$ screws
8) For flange plate securement: additional $3 \times$ M8/M10 screws
9) Only up to Size 32

## ROBA-stop ${ }^{\circledR}$-M - Short Description Installation

## Installation Conditions

- The eccentricity of the shaft end in relation to the mounting pitch circle must not exceed 0.2 mm .
- The positional tolerance of the threaded holes for the cap screws (Item 8, Fig. 2) must not exceed 0.2 mm
] The axial run-out deviation of the screw-on surface to the shaft must not exceed the permitted axial run-out tolerance acc. DIN 42955 N. Larger deviations can lead to a drop in torque, to continuous grinding of the rotor and to overheating.

Fig. 2

## Installation

1. Mount the hub (1) onto the shaft and secure it axially (e.g. using a locking ring).

- Recommended tolerance of hub-shaft connection H7/k6.
- Avoid too tight hub-shaft connections (particularly on max. bores).
- Keep the friction surfaces free of oil and grease.

## Attention!

Please observe supporting length of the key acc. Dimensions on page 5
2. If necessary (dependent on Type), move the friction disk or the flange plate over the shaft and attach it to the machine wall (or screw on for size 1000).

- If there are no suitable counter-friction surfaces made of grey cast or steel available, please use brake Types 891._ _2/3. (with friction disk (9)) or 891._ . $4 / 5$._ (with flange plate).
When using a brake with a friction disk (Type 891._ _2/3._), please observe the stamp "friction side" on the friction disk.

3. Push the rotor (3) onto the hub (1) by hand.
4. If necessary, install the hand release (only on sizes $2-500 /$ the emergency hand release is partly assembled on size 1000)
5. If necessary (dependent on Type, Type 891. _ _.1), insert the O-ring into the axial recess of the coil carrier (2).
6. Push the rest of the brake over the hub (1) and the rotor collar (3).
7. Attach the brake onto the motor bearing shield or onto the machine wall evenly all around using the cap screws (8) - please observe the seal dependent on the type - with a torque wrench and tightening torque (acc. Table 1, page 7).

## Attention!

Only use mayr ${ }^{\circledR}$ original screws (Table 1, page 7).

## Braking Torque Adjustment

Different torque adjustments can be made using different spring configurations (6) in the coil carrier (2) (see Table 3, page 7).

## Hand Release Installation (Sizes 2-500)

On Type 891._ _ _. 1 installation of the hand release is only possible if a request for a hand release is stated on the brake order form (completely enclosed coil carrier (2)).
For hand release installation, the brake must be dismantled and de-energised.
Installation Procedure (Figs. 1 and 2):

1. Unscrew brake from the motor bearing shield or from the machine wall.
2. Remove the sealing plugs from the hand release bores in the coil carrier (2).
3. Put the thrust springs (10) onto the threaded bolts (11). The threaded bolts (11) come manufacturer-side assembled with a key as tension element and secured with adhesive up to Size M60. This connection must not be loosened.
4. Push the threaded bolts (11) with thrust springs (10) from the inside (you should be facing the magnetic coil (7)) into the hand release bores in the coil carrier (2).
5. Push the O-rings (only with sealed hand release, Type 891._ _ .1) over the threaded bolts (11) and insert them into the recesses of the coil carrier (2).
6. Push intermediate plates (only with sealed hand release, Type 891._ _ _.1) over the threaded bolts (11).
7. Mount the switch bracket (12), add the washers (13) and lightly screw on the self-locking hexagon nuts (14)
8. Tighten both hexagon nuts (14) until the armature disk (5) lies evenly against the coil carrier (2).
9. Loosen both hexagon nuts (14) by " $Y$ " turns (see Table 1, page 7), thereby creating an air gap between the armature disk (5) and the coil carrier (2) or the inspection dimension "x" (see Page 7 Table 1).
Attention!
An uneven adjustment dimension on the hand release can cause the brake to malfunction.
10.After installing the release cover, screw the hand release rod (15) into the switch bracket (12) and tighten it. The hand release rod (15) must be protected against loosening using a screw-securing product, e.g. Loctite 243.

## Maintenance

ROBA-stop ${ }^{\circledR}-\mathrm{M}$ brakes are mainly maintenance-free.
However, the rotor (3) is subject to operational wear.
The friction linings are robust and wear-resistant. This ensures a particularly long service lifetime.
If the rotor (3) does become worn due to the high total friction work, and the function of the brake can no longer be guaranteed, the brake can be re-set to its functional state by replacing the rotor. For this, the brake must be cleaned thoroughly.
The wear condition of the rotor (3) is determined by measuring the release voltage (this must not exceed max. 90 \% of the nominal voltage on a warm brake), or by measuring the rotor thickness on a dismantled brake ("minimum rotor thickness" acc. Table in the currently valid Installation and Operational Instructions). On sizes 500 and 1000 there is an air gap inspection opening. This means that the brake does not have to be dismantled.

## Attention!

The brake function cannot be guaranteed on brakes with a reduced braking torque and/or operation with a fast-acting rectifier if the friction linings are heavily worn.
Unpermittedly high wear relaxes the thrust springs (6), leading to a drop in torque.
your reliable partner

## Table 3

1) Brake operation only possible with overexcitation.
2) The braking torque (switching torque) is the torque effective in the shaft train of a slipping brake with a sliding speed of $1 \mathrm{~m} / \mathrm{s}$ in relation to the mean friction radius (acc. VDE 0580/07.2000).

## ROBA-stop ${ }^{\circledR}-\mathrm{M}$ - Brake Dimensioning

## Brake Size Selection

## 1. Brake selection

$M_{\text {erf. }}=\frac{9550 \times P}{n} \times K \leq M_{2}$
[ Nm ]
$\mathrm{t}_{\mathrm{v}}=\frac{\mathrm{J} \times \mathrm{n}}{9.55 \times \mathrm{M}_{\mathrm{v}}}$
$M_{v}=M_{N}+(-)^{*} M_{L}$
[sec]
[ Nm ]

## 2. Inspection of thermic load

$Q_{r}=\frac{J \times n^{2}}{182.4} \times \frac{M_{2}}{M_{v}}$
[J/ braking]

The permitted friction work (switching work) $Q_{r \text { zul. }}$ per braking for the specified switching frequency can be taken from the frictionpower diagrams (page 9).
If the friction work (switching work) per braking is known, the max. switching frequency can also be taken from the Friction-Power Diagrams (page 9).

## Names:

Speed

Braking action

Mass moment of inertia
( $\geq 1.5-3 \times$ according to conditions)

Required braking torque
Load torque * sign in brackets (-) is valid if load is braked during downward movement

Nominal torque (Technical Data page 4) Please observe the braking torque tolerance!

Connection time (Table 6 page 12)
Friction work present per braking
Friction work per 0.1 mm wear (Table 4)
Friction work up to rotor replacement (Table 4)
$Q_{r \text { rul. }}$ [J]

Permitted friction work (switching work) per braking action

Due to operating parameters such as sliding speed, pressing or temperature the wear values can only be considered guideline values.
When using a brake with a friction disk (Type 891._ _2._), the max. friction work and friction power must be reduced by $30 \%$ for Sizes 2 to 16 and by $50 \%$ for Sizes $32-60$. The wear values $Q_{r 0.1}$ and $Q_{r g e s .}$ are therefore not valid.

## ROBA-stop ${ }^{\circledR}$-M - Friction-Power Diagrams

## ROBA-stop ${ }^{\circledR}$-M - Further Options

In addition to the standard brakes, mayr ${ }^{\circledR}$ power transmission provides a multitude of further designs, which cannot be described in detail in this catalogue.

## Some of the most frequently requested options are:

- Microswitch / proximity switch for switching condition indication (release monitoring), Fig. 1
- Microswitch for wear indication (wear monitoring), Fig. 2
- Customer-specific flange plate, Fig. 3
- IP65 design for continuous shafts, Fig. 4
- Noise damping (O-ring damping between the gear hub and the rotor), Fig. 5
- $\mathrm{ACH}=$ Anti-Condensation heating, Fig. 6
- Lockable hand release

Please contact mayr ${ }^{\circledR}$ power transmission for further information

## Release monitoring

When the magnetic coil in the coil carrier (2) is energised, the armature disk (3) is pulled towards the coil carrier (2). The microswitch / proximity switch (1) emits a signal and the brake is released.

Fig. 1

## Continuous shaft with IP65

The enclosed design (IP65) is equipped with a screw plug (sizes 8 to 500) or with a sealing cover (size 1000) (see Type 891._14.1, page 5) as part of the standard delivery.
A radial shaft sealing ring (1) is installed in the coil carrier (2) on continuous shafts.

## Damping rotor/toothed hub

If vibrations in the drive line cannot be avoided, an O-ring (1) is used to damp backlash between the toothed hub (6) and the rotor (5).

Fig. 5

## Wear monitoring

Due to wear on the rotor (5), the nominal air gap "a" between the coil carrier (2) and the armature disk (3) increases. If the limit air gap (see table in the Installation and Operational Instructions) is reached, the microswitch contact (1) switches over and emits a signal. The rotor (5) must be replaced.

Fig. 2

- Double rotor design, Fig. 8
- CCV-design, Fig. 9
- ATEX design
- Special friction material
- Backlash-free design
- Special coil voltages

## Special flange plate

We offer a range of flange plates for customer-specific solutions, such as for example the special flange plate shown in Fig. 7 (1) with customertailored centering (8) and sealing (7).

Fig. 3

your reliable partner

## ROBA-stop ${ }^{\circledR}$-M - Further Options

Lockable
hand release
In de-energised condition,
the brake with lockable hand
release can be released
manually. By deflecting the hand
release rod (1), the armature disk
(3) is pushed against the thrust
springs (4) onto the coil carrier
(2) and the braking torque is
removed, Figs. 7a and 7b.

Coil | Se-energised |
| :--- |
| energised |

Shaft braked

## Double rotor design

Double rotor design for increased torque at small outside diameter.

## CCV-design

Cold Climate safety brake Type 891.4__._Sizes 16-150 GL-certified up to $-40^{\circ} \mathrm{C}$.

For further information please see brochure: ROBA-stop ${ }^{\circledR}-M$ CCV P.891400.V

Fig. 9

## ROBA-stop ${ }^{\circledR}-\mathrm{M}$ - Switching Times

## Switching Times

The values stated in the table are mean values which refer to the nominal air gap and the nominal torque on a warm brake.

| Switching times ${ }^{1)}$ |  |  | Size |  |  |  |  |  |  |  |  |  |  |

Table 6

Diagram 5: Switching times for brake operation with coil nominal voltage

1) Standard brakes with a braking torque adjustment of $34 \%$ and $50 \%$ have substantially longer connection times $t_{1}$ and must not be used for switching time-relevant applications.
2) The separation time $t_{2}$ of holding brakes is 1.4 times longer than the separation time of standard brakes (100 \%)
3) Value for operation with overexcitation

Names:
$M_{B r} \quad=$ Braking torque
$M_{L} \quad=$ Load torque
$\mathrm{t}_{1} \quad=$ Connection time
$t_{11}=$ Response delay on connection
$\mathrm{t}_{2}=$ Separation time
$\mathrm{U}_{\mathrm{N}} \quad=$ Coil nominal voltage

## ROBA-stop ${ }^{\circledR}$-M - Electrical Connection

## Electrical Connection and Wiring

DC current is necessary for operation of the brake. The coil voltage is indicated on the Type tag as well as on the brake body and is designed according to the DIN IEC 60038 ( $\pm 10$ \% tolerance). Operation can take place with alternating voltage using a mayr ${ }^{\circledR}$-DC voltage module or another suitable DC power supply. The connection possibilities can vary dependent on the brake equipment. Please follow the exact connections according to the Wiring Diagram. The manufacturer and the user must observe the applicable regulations and standards (e.g. DIN EN 60204-1 and DIN VDE 0580). Their observance must be guaranteed and doublechecked!

## Earthing Connection

The brake is designed for Protection Class I. This protection covers not only the basic insulation, but also the connection of all conductive parts to the protective conductor (PE) on the fixed installation. If the basic insulation fails, no contact voltage will remain. Please carry out a standardised inspection of the protective conductor connections to all contactable metal parts!

## Device Fuses

To protect against damage from short circuits, please add suitable device fuses to the mains cable.

## Switching Behaviour

The reliable operational behaviour of a brake is to a large extent dependent on the switching mode used. Furthermore, the switching times are influenced by the braking torque adjustment, temperature and the air gap between the armature disk and the coil carrier (dependent on the wear condition of the linings).

Diagram 6

Operation with overexcitation requires an inspection of :

- the required overexcitation time *
- as well as the RMS coil capacity ** with a cycle frequency higher than 1 cycle per minute (see page 14).

## * Overexcitation time $\mathbf{t}_{0}$

Increased wear, and therefore an increasing air gap as well as coil heating lengthen the separation times $t_{2}$ for the brake. For this reason, at least double the separation time $t_{2}$ at nominal voltage must be selected as overexcitation time $t_{0}$ on each brake size
The spring forces also influence the brake separation times $t_{2}$ : Higher spring forces increase the separation times $t_{2}$ and lower spring forces reduce the separation times $t_{2}$.

## Magnetic Field Build-up

When the voltage is switched on, a magnetic field is built up in the brake coil, which attracts the armature disk to the coil carrier and releases the brake.

## - Field Build-up with Normal Excitation

If the magnetic coil is energised with nominal voltage, the coil current does not immediately reach its nominal value. The coil inductivity causes the current to increase slowly as an exponential function. Accordingly, the build-up of the magnetic field takes place more slowly and the braking torque drop (curve 1, diagram 6) is also delayed.

## - Field Build-up with Overexcitation

A quicker drop in braking torque is achieved if the coil is temporarily placed under a higher voltage than the nominal voltage, as the current then increases more quickly.
Once the brake is released, it needs to be switched over to the nominal voltage (curve 2, diagram 6). The relationship between overexcitation and separation time $t_{2}$ is roughly indirectly proportional. This means that, using overexcitation voltage $U_{0}$ (= doubled nominal voltage $U_{N}$ ), the separation time $t_{2}$ for release of the brake is halved. The ROBA $^{\circledR}$-switch fast acting rectifier works on this principle.

## ** Coil capacity P

$\mathbf{P} \leq \mathbf{P}_{\mathbf{N}}$
The coil capacity P must not be larger than $\mathrm{P}_{\mathrm{N}}$.
Otherwise the coil may fail due to thermic over-
load.

Calculations:

| P | [W] | RMS coil capacity dependent on swit frequency, overexcitation, reduction in capacity duty cycle |
| :---: | :---: | :---: |
|  |  | $P=\frac{P_{O} \times t_{O}+P_{H} \times t_{H}}{}$ |
|  |  | T |
| $\mathrm{P}_{\mathrm{N}}$ | [W] | Coil nominal capacity (catalogue values, Type |
| $\mathrm{P}_{\mathrm{o}}$ | [W] | Coil capacity on overexcitation $P_{o}=\left(\frac{U_{O}}{U_{N}}\right)^{2} \times P_{N}$ |
| $\mathrm{P}_{\mathrm{H}}$ | [W] | Coil capacity at reduced capacity $P_{H}=\left(\frac{U_{H}}{U_{N}}\right)^{2} \times P_{N}$ |
| $\mathrm{t}_{0}$ | [s] | Overexcitation time |
| $\mathrm{t}_{\mathrm{H}}$ | [s] | Time of operation with reduction in capacity |
| $\mathrm{t}_{\text {off }}$ | [s] | Time without voltage |
| $\mathrm{t}_{\text {on }}$ | [s] | Time of operation $\left(t_{0}+t_{H}\right)$ |
| T | [s] | Total time ( $\mathrm{t}_{\mathrm{O}}+\mathrm{t}_{\mathrm{H}}+\mathrm{t}_{\mathrm{off}}$ ) |
| $\mathrm{U}_{0}$ | [V] | Overexcitation voltage (bridge voltage) |
| $\mathrm{U}_{\mathrm{H}}$ | [V] | Holding voltage (half-wave voltage) |
| $\mathrm{U}_{\mathrm{N}}$ | [V] | Coil nominal voltage |

## Time Diagram:

Diagram 7

For brakes, which do not require overexcitation, the holding voltage $\mathrm{U}_{\mathrm{H}}$ may be lower than the nominal voltage $\mathrm{U}_{\mathrm{N}}$, e.g. on power reduction to reduce the coil temperature.

## Magnetic Field Removal

- AC-side Switching

The power circuit is interrupted in front of the mayr-DC voltage module. The magnetic field slowly reduces. This delays the rise in braking torque.

When switching times are not important, please switch AC-side, as no protective measures are necessary for the coil and the switching contacts.

AC-side switching means low-noise switching; however, the brake engagement time is longer (approx. 6-10 times longer than with DC-side switch-off), use for non-critical braking times.

- DC-side Switching

The power circuit is interrupted between the mayr ${ }^{\circledR}$-DC voltage module and the coil as well as mains-side. The magnetic field reduces extremely quickly. This causes a quick rise in braking torque.

When switching DC-side, high voltage peaks are produced in the coil, which can lead to wear on the contacts from sparks and to destruction of the insulation.

DC-side switching means short brake engagement times (e.g. for EMERGENCY STOP operation); however, louder switching noises.

## - Protection Circuit

When using DC-side switching, the coil must be protected by a suitable protection circuit according to VDE 0580, which is integrated in mayr ${ }^{\circledR}$-DC voltage module. To protect the switching contact from consumption when using DC-side switching, additional protective measures may be necessary (e.g. series connection of switching contacts). The switching contacts used should have a minimum contact opening of 3 mm and should be suitable for inductive load switching. Please make sure on selection that the rated voltage and the rated operating current are sufficient. Depending on the application, the switching contact can also be protected by other protection circuits (e.g. mayr ${ }^{\circledR}$-spark quenching unit), although this may of course then alter the switching times.

## Half-wave and bridge rectifiers Type 02_000.6

## Application

Rectifiers are used to connect DC consumers to alternating voltage supplies, for example electromagnetic brakes and clutches (ROBA-stop ${ }^{\oplus}$, ROBA-quick ${ }^{\oplus}$, ROBATIC ${ }^{\ominus}$ ), electromagnets, electrovalves, contactors, switch-on safe DC motors, etc.

## Function

The AC input voltage $U_{1}$ is rectified in order to operate consumers with DC voltage $\mathrm{U}_{0}$. Also, voltage peaks, which occur when switching off inductive loads and which may cause damage to insulation and contacts, are limited and the contact load reduced.

ROBA ${ }^{\circledR}$-switch Type 017._00.2

## Application

ROBA $^{\oplus}$-switch fast acting rectifiers are used to connect DC consumers to alternating voltage supplies, for example electromagnetic brakes and clutches (ROBA-stop ${ }^{\circledR}$, ROBA ${ }^{\circledR}$-quick, ROBATIC ${ }^{\circledR}$ ) as well as electromagnets, electrovalves, etc.

Fast acting rectifier ROBA ${ }^{\circledR}$-switch 017._00.2

- Consumer operation with overexcitation or power reduction
- Input voltage: 100-500 VAC
- Maximum output current $\mathrm{I}_{\text {RMS }}$ : 3 A at 250 VAC
- UL-approved

## Function

The ROBA ${ }^{\circledR}$-switch is used for operation at an input voltage $\mathrm{U}_{1}$ of between 100 and 500 VAC, depending on the size. They can switch internally from bridge rectification $U_{0}$ output voltage to half-wave rectification $U_{H}$ output voltage. The bridge rectification time can be modified from 0.05 to 2 seconds by exchanging the external resistor $\left(\mathrm{R}_{\text {exx }}\right)$.

## ROBA ${ }^{\circledR}$-switch Type 017.110.2

## Application

ROBA $^{\circledR}$-switch fast acting rectifiers are used to connect DC consumers to alternating voltage supplies, for example electromagnetic brakes and clutches (ROBA-stop ${ }^{\circledR}$, ROBA ${ }^{\circledR}$-quick, ROBATIC ${ }^{\circledR}$ ) as well as electromagnets, electrovalves, etc.

## Fast acting rectifier ROBA ${ }^{\circledR}$-switch 017.110.2

- Integrated DC-side disconnection
(shorter connection time $\mathrm{t}_{1}$ )
- Consumer operation with overexcitation or power reduction
- Input voltage: 100 - 500 VAC
- Maximum output current $\mathrm{I}_{\text {RMS }}$ : 1.5 A
- UL-approved

The ROBA ${ }^{\circledR}$-switch with integrated DC-side disconnection is not suitable for being the only safety disconnection in applications!

## Function

The ROBA $^{\circledR}$-switch is used for operation at an input voltage of between 100 and 500 VAC, depending on the size. They can switch internally from bridge rectification $U_{0}$ output voltage to half-wave rectification $U_{H}$ output voltage. The bridge rectification time can be modified from 0.05 to 2 seconds by exchanging the external resistor $\left(R_{\text {ext }}\right)$.
Apart from this, the ROBA ${ }^{\circledR}$-switch has an integrated DC-side disconnection. In contrast to the usual DC-side disconnection, no further protective measures or external components are required. The DC-side disconnection is activated in standard mode (terminals 3 and 4 are not wired) and causes short switching times on the electromagnetic consumer.
The integrated DC-side disconnection is deactivated by fitting a bridge between the terminals 3 and 4 . The coil is de-energised via the freewheeling diode. This has the advantages of softer braking and a lower switching noise. However, this substantially lengthens the switching times (approx. 6-10x).

## Electrical Connection (Terminals)

## ROBA ${ }^{\oplus}$-switch 24V Type 018.100.2

## Application

ROBA ${ }^{\circledR}$-switch 24 V fast switching modules are used to operate DC consumers with overexcitation or power reduction, for example electromagnetic brakes and clutches (ROBA-stop ${ }^{\circledR}$, ROBA $^{\circledR}$-quick, ROBATIC ${ }^{\circledR}$ ), electromagnets, electrovalves, etc.

## Fast switching module ROBA ${ }^{\circledR}$-switch 24V 018.100.2

- Consumer operation with overexcitation or power reduction
- Integrated DC-side disconnection (shorter connection time $\mathrm{t}_{1}$ )
- Input voltage: 24 VDC
- Max. output current I: 5 A
- UL-approved

## CAUTION

The ROBA ${ }^{\circledR}$-switch 24 V with integrated DC-side disconnection is not suitable for being the only safety disconnection in applications!

## Function

The ROBA ${ }^{\circledR}$-switch 24 V units are used for an input voltage of 24 VDC. They can switch internally, meaning that the output voltage switches to holding voltage from the input voltage (=overexcitation voltage) via pulse-width modulation using 20 kHz . The overexcitation time can be adjusted via a DIP switch to $150 \mathrm{~ms}, 450 \mathrm{~ms}, 1 \mathrm{~s}, 1.5$ s and 2.15 s . The holding voltage can be adjusted via a further DIP switch to $1 / 4,1 / 3,1 / 2$ and $^{2 / 3}$ of the input voltage (equals $6 \mathrm{~V}, 8 \mathrm{~V}, 12 \mathrm{~V}$ and 16 V at an input voltage of 24 V ).
Apart from this, the ROBA ${ }^{\circledR}$-switch 24 V has an integrated DC-side disconnection. In contrast to the usual DC-side disconnection, no further protective measures or external components are required. The DC-side disconnection is activated in standard mode and causes short switching times on the electromagnetic consumer. This can, however, be deactivated by installing a bridge between terminals 7 and 8 in order to produce soft brakings and quieter switching noises. However, this substantially lengthens the switching times (approx. 6-10x).

## ROBA ${ }^{\oplus}$-brake-checker Type 028.100.2

## Application

ROBA ${ }^{\circledR}$-brake-checker monitoring modules are used to operate safety brakes with overexcitation while at the same time monitoring the condition.
Monitoring module ROBA $^{\oplus}$-brake-checker 028.100.2

- Consumer operation with overexcitation or power reduction
- Controlled output voltage (on reduction)
- Simple adjustment of holding voltage and overexcitation time via a DIP switch
- Fast or slow switch off
- Brake condition recognition (release and drop-out recognition)
- Wear recognition and error recognition
- Wide input voltage range
- Maximum output current $\mathrm{I}_{\text {RMS }}$ : $10 \mathrm{~A} / 5 \mathrm{~A}$
- Maximum overexcitation current $\mathrm{I}_{\mathrm{O}}=20 \mathrm{~A} / 10 \mathrm{~A}$
- Automatic reduction of the holding voltage $U_{H}$

The ROBA $^{\circledR}$-brake-checker with integrated DC-side disconnection is not suitable for being the only safety disconnection in applications!

## Function

The ROBA $^{\circledR}$-brake-checker monitoring module is intended for use with an input voltage of 24 or 48 VDC. The module monitors the switching condition of the brake and emits a signal to provide information on the respective switching condition.
Critical conditions (line breakages, wear) can be recognised and the respective signal can be emitted via the warning signal output.
Switching of the output voltage to a controlled holding voltage (see "Table 1") is available as an option.

After a brake-specific overexcitation time period, the integrated automatic mode adjusts to the pre-set reduction voltage. The automatic mode can be switched off using a DIP switch

## ROBA ${ }^{\circledR}$-multiswitch Type 019._00.2

## Application

ROBA ${ }^{\circledR}$-multiswitch fast acting rectifiers are used to connect DC consumers to alternating voltage supplies, for example electromagnetic brakes and clutches (ROBA-stop ${ }^{\circledR}$, ROBA ${ }^{\oplus}$-quick, ROBATIC ${ }^{\circledR}$ ) as well as electromagnets, electrovalves, etc.

Fast acting rectifier ROBA ${ }^{\circledR}$-multiswitch 019._00.2

- Consistently controlled output voltage in the entire input voltage range
- Consumer operation with overexcitation or power reduction
- Input voltage: 100 - 500 VAC
- Max. output current $\mathrm{I}_{\text {RMS }}$ : 2 A ; 4.5 A
- UL-approved ROBA ${ }^{\circledR}$-multiswitch units are not suitable for all applications, e.g. use of the ROBA ${ }^{\circledR}$-multiswitch when operating noise-damped brakes is not possible without taking additional measures. The product's suitability should be checked before use.

## Function

The ROBA $^{\circledR}$-multiswitch is used for operation at an input voltage of between 100 and 500 VAC, depending on the size. After switchon, it emits the rectified bridge voltage for 50 ms and then adjusts automatically to a pre-programmed overexcitation voltage. After the overexcitation time ends, it regulates to the permanently programmed holding voltage. For the overexcitation voltage and holding voltage values of the standard design, please see Table 1. On special designs, deviating values are possible.
The overexcitation time can be adjusted via a DIP switch to 150 ms , $450 \mathrm{~ms}, 1 \mathrm{~s}, 1.5 \mathrm{~s}$ and 2 s .

## Spark Quenching Unit Type 070.000.6

## Application

Reduces spark production on the switching contacts occurring during DC-side switch-off of inductive loads.

- Voltage limitation according to VDE 0580 2000-07, Item 4.6.
- Reduction of EMC-disturbance by voltage rise limitation, suppression of switching sparks.
- Reduction of brake engagement times by a factor of 2-4 compared to freewheeling diodes.

## Function

The spark quenching unit will absorb voltage peaks resulting from inductive load switching, which can cause damage to insulation and contacts. It limits these to 70 V and reduces the contact load. Switching products with a contact opening distance of $>3 \mathrm{~mm}$ are suitable for this purpose.

## ROBA ${ }^{\oplus}$-SBCplus

## The safe brake control - for use up to PLe and SIL CL3

## Application

The safe brake control ROBA ${ }^{\circledR}$-SBCplus is used to control and monitor two ROBA-stop ${ }^{\circledR}$ safety brakes, especially in applications, which have to fulfill requirements regarding person protection according to the standards for functional reliability, such as for example ISO 13849 and IEC 62061.

## Characteristics:

- Safe electronic switching of two brakes
- Input voltage power circuit 24-48 VDC
- Connection for up to 2 brakes up to $4.5 \mathrm{~A} / 24$

VDC or 2.25 A / 48 VDC (108 W)

- Output voltage (holding voltage) can be selected 6,8,12,24,48 VDC
$\rightarrow$ Power reduction, temperature reduction, electricity costs reduction
- Overexcitation time configurable
- Feedback inputs release monitoring for proximity switch or microswitch
- Monitoring for plausibility of the feedback
$\rightarrow$ Error diagnostics of the brake
- Status and error outputs for feedback to the control
- No mechanic contacts for controlling and monitoring
$\rightarrow$ High reliability, no wear, independent of cycle frequency and cycle rate
- Fast ("DC-side") or slow ("AC-side") switch off possible
- Galvanic separation between the control part and the power part
$\rightarrow$ Prevention of EMC issues
- Four integrated functions:

Contactor, 24 VDC fast-acting rectifier, safety relay, spark quenching

- Safe holding voltage and overexcitation time
- Safety functions are programmed into the RO$B A^{\circledR}-S B C p l u s$ and only have to be parameterised
$\rightarrow$ Plausibility check integrated and must not be programmed and validated
- Applicable up to PLe and SIL CL3, Type examination TUV Süd
(German Technical Inspectorate)

## Maximum switching reliability

The brake control must safely interrupt the current in the magnetic coil on switching off the brake. The RO$B A^{\oplus}-S B C$ plus module works with wear-free electronic semiconductors and thus achieves almost unlimited switching frequencies and switching reliability.

## Safe inner configuration

Amongst other things, the internal diagnostics inspections for short circuits, earth short-circuits and line breaks as well as safe overexcitation for releasing the brake and switching to reduced holding voltage when the brake is opened are the components required for "fail-safe" inner configuration.

## Numerous safety functions

Numerous safety functions permit comprehensive error diagnostics. The brake voltage is monitored. An excessively high voltage could dangerously extend the drop-out time on switch-off, if, for example, this were to cause a vertical axis to drop to an unpermittedly low level. The monitoring of the switching times, which influence the braking distance, is therefore another component of error diagnostics.

## Safe switching condition monitoring

The signal evaluation of the release monitoring with plausibility check permits a switching condition monitoring of the brake. The plausibility is controlled as follows: If voltage is applied, the brake must be opened after a defined time and vice versa. The switching condition monitoring can be used to reliably prevent the drive starting up against a closed brake. In this way, creeping errors, such as gradually increasing wear, which affects the switching times, can be detected.

## ROBA ${ }^{\oplus}$-torqcontrol

Adapted braking -

## Intelligent braking torque control module

In contrast to car brakes, safety brakes can only distinguish between two operating conditions due to their design, namely "braking torque present" and "no braking torque present". This is the reason why every braking procedure is carried out with the maximum braking torque available. Just as in a car, gradual, even deceleration is also often desired for devices and machine applications with dynamic braking actions. The new, intelligent braking torque control module ROBA $^{\circledR}$-torqcontrol by mayr ${ }^{\circledR}$ power transmission therefore offers an economically attractive solution to generate a variable braking torque for ROBA-stop ${ }^{\circledR}$ safety brakes, making it possible to decelerate machines evenly and gently.

## Continuous braking torque changes when in operation

Up to now, brakes have been dimensioned with regard to the maximum load where devices with variable loads, for example forklift trucks, are concerned. In case of partial loads, a stronger deceleration than necessary with the full braking torque can lead to damage to the transported goods or even to sliding of the wheels. If, however, the system detects the operating conditions and converts this information into a default signal for the new, intelligent control module by mayr ${ }^{\circledR}$ power transmission, electronic braking torque regulation is possible. Using the new system, the brake specialists have succeeded in continuously changing the contact force on the brake linings and therefore also the braking torque during operation. In this way, machines can be decelerated smoothly, adapted to the respective system requirements. Using the new, intelligent control device by mayr ${ }^{\circledR}$ power transmission, the resulting clamping force for the brake rotor can be specified to $25 \%, 50 \%$ or $75 \%$ of

the nominal spring force by means of two digital inputs. Alternatively, a continuous, analogue default signal from 0 to 10 V is possible. The switching device determines without using a sensor whether the armature disk is attracted or has dropped. This makes it possible to adjust the overexcitation time automatically as desired. With the new braking torque control module, mayr ${ }^{\circledR}$ power transmission provide the possibility to build up control circuits and brake movements intelligently - ideal prerequisites for application in the smart, interconnected machines of the future.

| Technical Data | Intelligent braking torque control module ROBA ${ }^{\oplus}$-torqcontrol |
